To answer the question first, yes I do.

The Supercharger contains an NEC v30 which is an 8086 look-alike with
some of the extra 286 instructions but not the virtual memory ones.
The SuperCharger can run Windows 3.0 in real mode. It can access only
1mb or ram.

The supplied software lets it do things other than run DOS stuff.
Its prime usefulness is as an adjunct to an ST as a 1mb ram-disk.

>me if I am wrong)

I have a DMA chip of this problematic batch in my MegaST. It worked fine
until I hooked some more items to the data bus (AltRAM, TOS 2.06 EPROMs, FPU...).
Then errors in data read/written to the hard disk started to appear. I found
out that everything returned to normal if I removed any one of the added
items- or at least 4 of the 6 old (TOS 1.04) ROMs.

The situation was somewhat (but not completely) improved whan I soldered a
large unpolarized capacitor accros power supply traces very close to the
DMA chip.

So it indeed looks like poor buffering, or something like that...

Been there, done that, several times, no t-shirt, and sometimes got
a whole department eliminated solving a problem that was expected to take
18 months in a week.

It is a matter of combined chip and board design. If you run a fast-
changing output line under the chip that made it, it may couple to
a chip support wire inside the IC, and put a hellacious bump into a slow
changing input, which at the very least, creates more input transitions,
and more output transitions, in a pattern called "chatter". It may also
produce bus errors.

You can, and did, do something to help. You will get less of this if you
make either your power supply more stable or your ground lower in
impedance. Ferrite beads on power lines, or a large cap and a small cap
across the power line helps with that. One can join isolated grounds
with a capacitor, to make the ground bigger.

One solution is to try a chip from another manufacturer, if available.
They are not all the same inside.

A better solution is, in board layout, run the output line manually away
from the chip, and then start the autorouter.

You reduced the load on the power supply, and got a better power supply,
and fewer errors.

Running a separate ground to that chip may also help.

Yes, you can call that poor buffering, but the chip is doing exactly
what it is intended to do. One Dave Small had a problem in this
area, and did not know what caused it, going broke in the process, and no
longer designing Atari hardware.

And also if you want to add Alt/Fast RAM, or if you want to use an IDE
hard disk...

Btw. there are also several bugs introduced in TOS 2.06, one of them
being that, for unknown reason, floppy formatting again does not seem to
produce MS-DOS-compatible volumes... But there is a utility that can fix
this bug and some others in a TOS 2.06 image before burning it to EPROMs...

The original Supercharger came with 1MB RAM and ran at 8Mhz. There was also a socket for fitting an 8087 math co-processor. The Norton speed rating was a little better than 4x faster than a standard XT.

Later came the Supercharger Plus, which was also housed in an external case. This was an upgraded version running at either 12 or 16 Mhz to provide better AT emulation.

Both were originally designed for those who had IBM compatible PC's at work and wanted to be able to run the same programs and files on their home machine.

Well, I would love to have a solid state hard disc on my TT.
One step forward to a completely silent TT.
I only need 512 Mb, could even do with only 256.

> The first question is what sort of flash card would be best?
> Do I need an ATA card, or will the linear type work?

Just wondering.
It should behave like a hard disc, shouldnt it?
The SCSI stuff would take care of the internals.

If HD-driver recognizes it as "direct access", it can just partion it
anyway you like, I would say.

If you can find more than 1, buy one for me.

Still 19 hours for this great piece of atari world : a collector !

http://cgi.ebay.fr/ws/eBayISAPI.dll?ViewItem&rd=1&item=5151684611&ssPageName
=STRK:MESE:IT

The most celebrous board CENTram ! BUT the FIRST version with four 8 bits
sockets for Falcon in 1993 and sold by RETOUR 2048 !

Designed on TT030 with Platon CAD software in 1992 !

This board was sold at more than 800 exemplaries from 1993 to1995 !!

THIS PROTOTYP (the only one !!) was told by the hands of RICHARD MILLER &
JACK TRAMIEL from ATARI Corp during an US Schow beginning 1993. About this,
I have a paper brief drawn from the hand of Richard Miller to explain how to
increase the power on the board (by coil adding).

The small story is that this board may habe been the official 14 MB atari
corp board, bought by atari corp because atari was on trouble to get enough
memory boards for all developers & pro falcons !

It is so an important piece for an atari museum !!

23. Chris Crosskey in the news!

Just curious...

As this appears to be completely feasible, is there any estimate on
how long such a card can be used instead of a hard disk before the
reduction of capacity becomes visible? Has anybody used it long enough?
AFAIK such cards have a limited number of write cycles available, about
1 million or so, isn't it? How long does it last in real life? And does
this limit appear to each bit individually or to a complete block
(one row?) ? Would the locations which get repeatedly overwritten
(config. files, logs... ?) be affected first?

This britt was triyng to get some sleep after all the explosions, they get louder each year im sure, im supprised all the windows in the area hadn't smashed due to the noise level..... then I played it safe and stayed inside, when I did venture out it looked like a apocalypse on the roads, never seen anything like it, miles of cops and car smashes, not just in my area either, I know mates in around the UK they all said it was the same..... few less drunks on the road now tho , 2005 started well IMHO ;-)

What little I've read about it claims the most modern consumer grade
flash media is now into several hundred thousand cycles per cell before
they'll go bad. Newer cards (at various prices of course) also have
circutry built in that's constantly testing sectors to make sure
they're safe to write on, and will verify the write then again, etc...

The industry must feel pretty confident about it now, for alot of the
mid and high end cards are shipping with 5 year warranty now.

I don't have any 'facts' to offer...but I see it like this...why not
give it a try? The media is now low cost enough to keep backups a
plenty. It's also quite faster and easier than ever before to make
said back-ups. I figure energy savings alone could buy a hell of alot
of flash ram cards.
It would also appear to me that this format is alot sweeter on the
pocketbook, storage space, and the environment in every way, than
traditional disk technologies.
It's smaller, cooler, and quieter too :)

Hey Joseph! I haven't done this yet since installing my CT60, but will try to soon and let ya know what happens! But I thought I'd mention that I've had things like this happen before, both on a stock , Nemisis, and CT2b falcon. But only intermitently. Don't know why, some CAF bug? You say this happens all the time with 060, but not 030?

I saw somewhere on the internet (the truth is out there but I forgot the URL) a little utility that allows you to protecting the MagiC O/S from being wrongfully written to or altered on the hard disc. Does anyone know anything mroe about or where I can get it as I lost the URL.

It is called "read only" flag, and it is part of TOS. Or any OS/Desktop replacement. <g>. I really don't see why u need special application to protect file to be overwritten or changed. TOS does that for you. Set files u want as "read only" and they can not be deleted or altered.

More usefull is utility which try to protect Magic in RAM, so other apps's can not write into Magic's memory area and causing a crash (system overwritten message). It does require CPU with MMU tho, aka, 030 and up.

Have you tried whether it works with the current demo version of
HDDRIVER? (http://www.seimet.de/hddriver_english.html) If the adapter
implements the standard SCSI command set there shouldn't be any problems.

Dr. Seimet,
Haven't tried the unit yet...it was in an auction, and the price was right, so I just ordered it. The seller says the unit should work fine with any standard SCSI card. It's 50 pin narrow...I'm guessing it's most likely a SCSI II class device. I'll know more when it gets here :)

Yes, I'll most likely be using HD Driver. I run version 7.06 on the CT2b Falcon, and 8.03 on the Mega. Currently the STacy had the old ICD type partitions goin' on, for the sake of the Mac Emulator that was set up ages ago and running some variant of the supera disk drivers. I have all that backed up to zip disks...but I'm tired of replacing hard to find drives in this STacy with yet another worn out drive. If I do end up running HD Driver on a third machine, would I need to register a third lisence? Not sure your policy on that.

The big hope here, is to get the thing working in the STacy, with its stock SCSI controller. I know it'll be tricky...some concerns include this....

That host is designed to only look at one device on ID 0. It doesn't have a parity genorator (tho' one can be added by hacking in a 30cent chip). The host doesn't comply with the true SCSI termination standards. I've read that with a hacked up cable you can fool the host into running two drives both set to ID 0. So In a nut shell, even if I can get the flash reader/writer to work with the host...I'll only be able to see one of the slots, and it's anyone's guess which slot it will be. If lucky...the flash reader will be highly configurable with jumpers and what not and I can pick one slot and disable the rest.

If this don't work...guess I'll have to hunt down another aged out overpriced SCSI I drive :/ True, there's a few more modern drives that can be 'choked down' and used in the thing...but they tend to be power hungry 7200RPM jobs 2gig and above, and they usually don't spin up in time to boot the STacy on power-up (gotta do the coldboot in auto-folder trick, or warmboot from cold GEM after spin-up).
The STacy power supply wasn't designed to deliver that kind of power...I've tried it, and while it works...I'm not cozy with how HOT the internal power supply gets.

I'm open to ideas...in the mean time...we'll wait, and find out when the device gets here :) I'm also keeping an eye out for a single slot SCSI based flash reader in an internal version...that has a better shot of working in the STacy.

Got a mono monitor sat on my sofa taking up seating space - also a
switching box to allow you to have 2 monitors connected and switch around
when needed.

All you need to do is travel to Liverpool (if Bradford is too far away
for you?) and collect it.

Just an idea that came up when I read your posting:

There are (quiet costy) SCSI<->IDE converters. One could use them for
attaching either an IDE HD or a CF-card placed in an IDE<->CF adapter
(which is inexpensive, only wiring).

I'm not sure if those SCSI<->IDE converters can access CF-"drives". Maybe
someone has the chance to try this out?

Regards,

Alexander

Update:
I made the CT60-suggested patch, removing the old one (the one with the IC mounted on the GAL and wires connected to some resistor places and to the ?SDMA? pin2).
The ting is that I can't tell the difference with the old one, since it behaves exactly the same!
I can't write to SCSI yet (in centscreen resolutions) and I have *exactly* the same behaviour of all other programs, including the illegal instruction of GemGraph:-(

Is there a way to tell how is the patch working?
NOTE: the old patch didn't make noise with SDMA TEST.
Ciao!

If I may add something to this issue, I'll say that it happened to me the
same thing, and some kind people here helped me by pointing out that it is a
'bounce' problem; it is matter of adding a resistor and a capacitor between
the button pins, check it out in this newsgroup.
Ciao

But shouldn't Rudolphe's patch be the very same regardless of the
motherboard revision?
And shouldn't it be the only actually suitable for CT60?

(BTW, should I get better results with the motherboard boost? I am just
using a non solder setup)

Thanks

Well, unfortunately I can't provide with any pics. I can only give you
some info, like that it's a 40-pin IC, and it's got the following
serial numbers on it:
CO25913-38
PH23-030
9M2 16

Any extra info you might want?
(btw, what's a 68 prong IC?)

Ronald,

If you're not going to use the 50MHz 68060, I might be willing to
take it off your hands. I got a CT60, but at the time, the only way I
could afford it is without the CPU. They've been just about impossible
to find since. Let me know. E-mail me at the address below. Thanks!

He's tried that many times now but hasn't quite made the full journey yet.

Good luck to him

Y

Well, I'm having to use it. I've been unable to find any faster 68060's
that work.

Sorry, wish I could have helped you more. :-(

52. Re: Bad STE HDD DMA chip replacement

Newsgroup: comp.sys.atari.st
Date: 2005-01-04 00:05:53 UTC
From: Jim DeClercq <jimd@panix1.panix.com>
Message-ID: <crcml1$cv1$1@reader1.panix.com>
Source record: 15279

I am replying to myself, but at least I know what I am talking about.

If the chip works on one board design, and not on another, if you have the tools and the time, and the chip is a DIP, put a socket under it. That will space the chip away from the offending trace. Doing that not only diagnoses the problem, it fixes it.

If you are going to replace the chip, and it is a DIP, put a socket under it anyway. If the problem is the board, and the replacement chip is the same part number, you will have the same problem.

Jim

From: Michael Geyer <geyer#SPAMKRZLBLOCK#@michael-geyer.de>
Message-ID: <Xns95D46393B3F48mpgeyerde@130.133.1.4>
Source record: 15282

Hello everyone,

I do have some text files which I wrote using "That's Write" on an Atari ST
in the early 1990s. I saved them using a password. Of course, I do not
remember that password today and so cannot open these files...
I had a short look into the files and it seems to me that the encryption
mechanism is not very complicated. However, I am not an expert in
encryption technology. Maybe someone else has done the work the decrypt
such "That's Write" text files or can give me a hint how to proceed?

Thanks & best wishes

Michael

56. [ANN]Zview beta 4

Newsgroup: comp.sys.atari.st
Date: 2005-01-04 14:53:48 UTC
From: Zorro <zorro271-1@yahoo.fr>
Message-ID: <41daae06$0$10249$626a14ce@news.free.fr>
Source record: 15283

Happy new year !,

Zview Beta4 is available.

The main news features in this version are:

- Read & Write codecs for TIFF added. (almost all)
- Read codecs for FAX added.
- Degas codecs reads now also Degas Elite uncompressed image(Thanks for the documentation Adam!).
- The encoder and decoder are now in the same plugin.
- Navigator frame scrolling optimised.
- Some internal change in picture to screen convertion.
- Extra check for reverse pixel byte added to support 15, 16, 24 and 32 bits mode of some weired Hades VDI driver (for Falcon NOVA card also).
- Picture with 4 characters extention (like "*.jpeg" or "*.tiff") are now handled correctly.

http://the.zorro.free.fr/zview.html

I have also made a port of GCC 3.3.3 (with the help of Patrice Mandin's patch); you can find it here:

http://the.zorro.free.fr/downloads/gcc-3.3.3.tar.gz

Ciao,
Zorro

I don't want to toy with IDE cables and adapters, so I stick with a 30GB IDE
(that is HUUUUUGE for my needs), and use SCSI for ZIP, and -soon- CD-R-W.

BTW: I boosted the motherboard, and here's what happened.
1. SCSI looks GREAT both with centscreen and without, and since I patched
it, I tried some amazing new resolutions:-) (but I am still waiting for
SuperVidel...)
2. Here is the cracking noise I didn't have before :-(

Ciao!

One of the pins was broken off - we think it was in shipping, because the seller claimed it was fine when he sent it. I tend to believe him because we exchanged several e-mails and he never tried to "duck and run" like some do - he was always prompt and courteous. The package was rather beat up when I received it. Just one of those things I guess.

I did check around for repairs 'n such but once the pin is broke, apparently its pretty well graveyard time. :-(

Rodolphe seemed to think he might be able to run a line from the broken pin, to where it needed to go, but we're talking no guarantees here, so I'm still thinking about that one.

I know I'd sacrifice a couple of virgins (if you can still find'em) for one of those rev 6 units that can overclock to 80-100 mhz. <grin>

See ya.

PS Here is a thought - during my search I did find a way to get 50mhz units (couldn't find any faster, so it did me no good), and that was by buying older accelerator cards for Amiga computers. There was a couple that used 50mhz 68060s. You might try e-bay for those. HTHs.

What do you mean that the "encryption mechanism is not very
complicated"? Can you actually see some of your text?

There are a lot of casual ways to encrypt data. A lookup table is
quite fast, although for the 128 ASCII 7-bit characters you would need
at least the 256 ASCII 8-bit character set since spaces and vowels
would need multiple mappings. Writing the file with 9 or more bit
characters would create the appearance of encryption for any program
trying to read 8-bit characters as well. The point is that there are
dozens of fast "dirty" techniques that work "well enough" to have
possibly been used.

One thing that might have been tried is a simple implementation of the
RSA algorithm. Although one usually uses huge prime numbers, RSA works
with any product of primes larger than the character set in use. Thus,
17 and 23 could have been used for P & Q for example (since 17 * 23 =
391, and 391 > the 256 possible ASCII 8-bit characters). Then if E = 3
(which it likely would be for speed reasons since we will use E as an
exponent), D = 235 would finish off the necessary setup.

The reason I think that RSA might have been used is that it was fairly
simple to implement and was the "new thing" in the 1980's (being
invented in 1978). Of course, 17 and 23 might well not be the primes
chosen, but it wouldn't be too tough to write a program to take each of
the first 10000 or so prime pairs and output the first line of one of
your files via that decryption. Most would be gibberish, but hopefully
one would be readable. More detail on the mathematics involved is at
http://world.std.com/~franl/crypto/rsa-guts.html.

Unfortunately, unless the encryption is truly trivial, you have a lot
of work to do, and might well do better attempting to brainstorm every

password you've ever used. May I suggest that you come up with a pattern for your passwords? For example, you might make your passwords "!QAZnnxx", where "!QAZ" are fixed, "nn" is the year you created the file, and "xx" are the first two characters of the file's name. Such an approach is easy to remember and difficult to guess.

I have used STeem (ST Emulator to run ST games on PC, under Window XP) just fine. No problem with it at all, although I have yet to update it.

Not sure of the latest version.

Not sure about the sound problem, because I am not sure which sound settings I should use in STeem to make it CLOSER to the real machine.

Any ideas, STeem'ers?

mike

Is it possible to play Atari ST games on PDA (Tungsten C) or Pocket PC (Dell x50v) device?

The cool thing I came across was a SD card with Atari 2600 (classic) for Pocket PC x50, which you can hook up to a "Video" (hence a "v" in Video for X50v).

I wonder....gotta be BIGGER than what Atari Lynx can do in a small limit size rom.

I'm beginning to wonder if I'm trying to do something CAF was not designed to do. Is it possible to mix down a stereo file to another stereo file? Sometimes this works, most of the time it does not. I was thinking it was my CT60, but I've now encountered the problem in 030 mode as well. I'm simply recording the file on channel "any" for stereo, then moving it to lanes 3 and 4 and making my changes, setting the output to "mix-left" and recording back to channel "any" on track 1. Since stereo files always output on audio channels 1 and 2, does this make it impossible to mix down stereo to stereo?

TIA

There is a program called CASTCE that runs on the iPAQ pocket PC (and
possibly others). Some have found it useful, but I get enough lockups
to make games of any length frustrating. Your mileage may vary. A
review is available here:
http://www.myatari.net/issues/apr2003/castce.htm . I'd be interested
in knowing if you get it to work reliably.

Blast the invading aliens. Colorful sprites fly around the window either trying to ram you or drop a bomb down your throat. Animated explosions flash on the screen while DMA sounds blast out of your speakers. Shoot or die, but watch out or you will blow your Accuracy bonus!

Catch your attention?

Gem Panic is the latest Gem game release from Anthill Industries.

Features Fully windowed game play
8 bit color sprites
DMA/XBIOS Sound support
Optional support for using GEMJing as sound playback

It has been tested on Falcon's, Milans, Hades, CT60's, MagicMac and MagicPC.

What's the catch? None. It's Freeware and open source. So have fun.

If your curious for some more info or just want to download it already pop over to http://www.gemcandy.org/

Hello everyone, just joined this newsgroup because I just learned of it ;-).

I'm looking to do some programming on STeem and I'm wondering where I can
get the following languages:

- C or C++ (preference on C++ I'm just not sure C++ existed for the ST back
then ;-)
- Pascal (preferable with Object extenstions so I can declare things as
OBJECT)
- The most recent version of GFA Basic that can be run on TOS 2.06 (or below
since i'm not sure if and how to setup anything more recent than that on
STeem). Im thinking 3.06 or 3.6 is what I remember seeing? but it's been
a while.

Any other languages you'd recommend for STeem ST / STE emulator?

Any valid good Falcon emulator out there? I had tosbox but that's
abandonned is there anything else out there I can use ? and any of the
above programming languages for the Falcon?

Thank you all :-)

Sorry, no Object PAscal.

> Any other languages you'd recommend for STeem ST / STE emulator?

PurePC.

> Any valid good Falcon emulator out there? I had tosbox but that's

> above programming languages for the Falcon?

Aranym. Aranym does not emulate any existing machine, but it is close to
Falcon, offers JIT and many other usefull things like extended
resolutions, networking, etc.

84. Kivi QWK free registered version

Newsgroup: comp.sys.atari.st
Date: 2005-01-07 10:36:25 UTC
From: ajalkane <ajalkane@gmail.com>
Message-ID: <1105094185.531671.274430@z14g2000cwz.googlegroups.com>
Source record: 15161

Hello,

I have no idea if anyone uses QWK readers in this internet time
anymore... but anyway, since I was asked for it I have made Kivi
QWK free and provided a registration file that unlocks the few missing
features and removes the nagging screen. I think I did that over
a year ago but I had troubles posting to this group for some reason :).
Anyway, the version 2.03 and the free key can be downloaded from here:

http://www.ntrautanen.fi/marko/saa/arkisto/softat/kivi_203.zip

Or if you just need the key get it from here:
http://www.hut.fi/~ajalkane/KIVI.KEY

Installing the key file requires nothing but saving it to the directory
where Kivi QWK resides.

Regards,
Arto

Hi Folks,

I'm trying to rescussitate my Atari Falcon after about five years of neglect. I've put it into a Wizztronics Rack case, and set it up with HDDriver (paid for) and a 20 GB IDE drive.

After restoring its previous boot setup, I've found that some of the boot programs aren't playing well together. There are several of them, all managed by SuperBoot Version 8.1.

Because I used SuperBoot, not all of these boot progs are expected to work well together.

My questions are,
1. What do these boot programs do?
2. Do I still need these today? Are there better equivalent programs?

```
Program Name Startup Text
============ ============
FPATCH2 FPATCH 2 Installed (Falcon Patch 2?)
I-DRIVIN DEVICE DRIVER SUPPORT 94-12-30 (Harun Scheutzow)
I-SCC Fast Routines for SCC M2/S2 (Harun Scheutzow)
NVDI V 3.02
FFSEL Freedom V 1.15
MMACEL34 Mouse Accelerator 3 V 4.0
FPPRNT Print Patch 1.0 (Frank Palowski)
DRVIN (Same as I-DRIVIN above)
SCC (Same as I-SCC above)
STIKTSR STIK TSR (TCP/IP)
```

There are more of them, but I know what the others are for.

Thanks for any help!

-dreq

FPPRINT was a patch written for the printing routines in the original
BIOS - no idea if it's still needed, but I do remember it doubling the
speed of printing to my old Star LC-10 from my STe.

Brad.

Hi, Zorro!
This program is coming out GREAT!
Now, I need to tell you that JPEG module crashes immediately both in 'open file' mode and in 'browser' mode as soon as a JPG is encountered. I copied the previous module (not the DSP one) and everything is fine. Any hint?
(CT60 with or without mobo boost)

Ciao!

Patches serial port (I think). I believe the STing package replaces
it.
> I-DRIVIN DEVICE DRIVER SUPPORT 94-12-30 (Harun Scheutzow)
Not sure -- probably part of FPATCH
> I-SCC Fast Routines for SCC M2/S2 (Harun Scheutzow)
Not sure -- probably part of FPATCH
> NVDI V 3.02
Faster VDI and print driver. Very important. Ended at V 5.x.
> FFSEL Freedom V 1.15
File selector. Very nice, but not always stable.
> MMACEL34 Mouse Accelerator 3 V 4.0
Mouse accelerator. I recommend Silkmouse instead
> FPPRNT Print Patch 1.0 (Frank Palowski)
Not sure.
> DRVIN (Same as I-DRIVIN above)
Yep.
> SCC (Same as I-SCC above)
Yep.
> STIKTSR STIK TSR (TCP/IP)

Replaced by STIK 2 and STing. STing seems to have a larger following, from what I can tell, but STIK 2 works well.

Generally, boot order matters more than the boot program. Post your boot order and I'll take a look at it.

Well, that depends on personal preference and experience (i.e. how did
your monitor/tv/stereo system souded like to you). Luckily the Steem
authors offer 3 different filters so you can choose what's closest to
your memories.

Brad, Galen,

Thanks for the responses.

With your help, as well as some involved web searching, I've gotten the answers.

> Program Name Startup Text
> ============ ============
> FPATCH2 FPATCH 2 Installed (Falcon Patch 2?)

According to http://www.umich.edu/~archive/atari/Falcon/0index, this is a useful patch: "Fixes 2 TOS 4.0/4.04 problems with sound, Bconmap()"

> I-DRIVIN DEVICE DRIVER SUPPORT 94-12-30 (Harun Scheutzow)
> I-SCC Fast Routines for SCC M2/S2 (Harun Scheutzow)
And:
> DRIVIN (Same as I-DRIVIN above)
> SCC (Same as I-SCC above)

According to http://www.oxxus.net/host/2.2.26/hosting-atari_MFPser.htm, Harun Scheutzow is developer of RSVE, RSFI, ST_ESCC and hsmoda-package, so the evidence points to these being Serial Port fixes & enhancements. STIK2 or STing will replace them.

The rest of them are as Galen and Brad described.

Galen: Here's the boot order I've been using. Note that with SuperBoot, I enable only the ones I need for a specific session. The Falcon can boot to MiNT or GEMDOS depending on the programs I plan to use.

1. FPATCH2, 2. I-DRIVIN, 3. I-SCC, 4. MINTNP (disabled when booting GEMDOS), 5. NVDI, 6. UIS_III, 7. FFSEL, 8. SPGDOS, 9. SAM, 10. MACCEL34, 11. DESKPIC, 12. FPPRNT, 13. BLOWBOOT, 14. DRIVIN, 15. SCC, 16. STIKTSR, 17. (pre-HDDRIVER) SCSIDRV

Several of these have been disabled during my recent tests, including UIS_III, SCSIDRV, MINTNP (I plan to download FreeMiNT), SAM, and DESKPIC.

Thanks again for the help!

-dreq

98. Weird Disk problem

Newsgroup: comp.sys.atari.st
Date: 2005-01-08 19:39:46 UTC
From: Adam Kłobukowski <atari@gabo.pl>
Message-ID: <crpcq8$dk9$2@atlantis.news.tpi.pl>
Source record: 15173

Hello

From time to time few first sectors of my HDD get zeroed, for no known reason.

This includes boot record, partition table and part of fat of first partition.

It happened for me at least 3 times during last 3 years. It happened on two (or maybe three or four - my memory is a bit fuzzy here) diffrent disks, so this does not seem to be a disk issue.

There are no symptoms, I cannot reproduce it. Falcy was working fine, i turn it off, after some time I turn it on again and tada: beggining of disk is gone to data-heavne (wherever that is).

Fortunetly I do not keep valuable information on my C partition, and I do backups of it often, so recovery is just a matter of minutes.

Aditionally: it happened both when my falcy was plain (no accelerator) and after I fitted CT60 (no busspeder yet).

Also: I do not use any software that is known to faulty and could harm my data.

If anybody does have any reasonable explanation of this, please rise your hand and step forward.

I remember the first Falcons had a problem with overwriting the beginning of a partition when the partition before it became full. This doesn't sound like whats happening to you though - do you have the first TOS 4.x version? Just a thought.

Hi All,
Haven't posted here in a while.
I seem to be having a timing problem playing Atari MIDI files on a peecee.
The problem is that a 3 minute song flashes by in 3 seconds on the peecee.
I tried converting to both Normal and Simple, with and without a
conductor track, and with and without Auto, using the program they were
created with (files were created with Midisoft Studio). Midisoft creates an
SNG file but it's not compatible with other SNG files or I would have tried
to convert the SNG to MID with another MIDI program to see if it helped.
Any thoughts?

john

FPATCH2 is'nt needed with NVDI 5.01. Don't know about 3.02
StikTSR??? I use Stik2. Boot order for Stick2 is Drvin, SCC, Stik2
(I put the 3 last). Drvin and SCC are from HSMODEM and are configurable.
I don't think FPRINT is used in conjuction with NVDI.
I also have Wdialog for NVDI

Hallo Adam!

AK>From time to time few first sectors of my HDD get zeroed, for no known
AK>reason.

Just one thought: In HDDRIVER, there's an option to write-protect the root sector. Is that option active? If it is, and the problem arises anyway, it's likely some hardware problem IMO.

With best regards
Ekkehard

Hi Ronald!

RJH>I remember the first Falcons had a problem with overwriting the
RJH>beginning of a partition when the partition before it became full.

I've seen this problem also, and at that time I was running TOS 4.04 only, but with HUSHI as hard disk driver. But nowadays I'm using MagiC or MiNT and HDDRIVER, and moreover have way bigger hard disks, and thus haven't seen that problem for years.

With best regards
Ekkehard

106. Little Green Desktop (LGD)

Hi,
Sorry if this has already been asked / answered.
Does anyone know where that really cool site, LGD (www.atari.st) has gone?
Seems to have disappeared off the face of the, um, internet.

Thanks.

113. Anyone interested in a Falcon from New Zealand?

Newsgroup: comp.sys.atari.st
Date: 2005-01-10 05:41:36 UTC
From: Chris Wilkinson <misterblobby@NOSPAMsnap.net.nz>
Message-ID: <1105335310.481673@kyle.snap.net.nz>
Source record: 15188

Hi there,

Subject says all...I have a 1994 Falcon030 with 16MB RAM
and a PowerUp2 accelerator. Currently there is no hard disk
in the Falcon but I have a 6.4GB Hitachi laptop drive I can
shoe-horn into it...thats provided I can source and get cheaply
a new 44-way mini-IDE cable since the original one is completely
bung...also the rotten infernal (internal) speaker is missing
too, and there is a small slot cut in the back of the case (to
let out an IDE cable for a 3.5" IDE disk). This Falcon is ex.
System Solutions and has an audio mod to fix a few issues.
I have APEX media, NVDI 3, and a few other titles to go with
it...

Freight might be a killa, but I'm moving from NZ to Australia
and am *not* interested in lugging this around anymore. Its a
shame cos I enjoyed owning and using it, but it is no longer
useful for me...

As a option I have a complete disk image of a 1.2GB 3.5" drive
hosted on my Linux PC (boots ARAnyM emulator), which I can put
back on the original 3.5" hard disk (means disk is external
since there is *no room* to fit the particular hard disk!) :-(

Anyone in NZ (or maybe Australia?) interested?

Shipping to the US costs between $50-$80 USD. Not a complete deal
killer.. What do you want for it?

Thanks,
Mark

NVDI and SPGDOS can interfere with each other, if I recall. SPGDOS is
generally not needed if you have NVDI anyhow.

This looks O.K, although MINT likes to be at the end, and you may need
WDIALOG for some of the NVDI features. I would recommend disabling
I-DRIVIN, I-SCC, FFSEL, SPGDOS, SAM, FPPRNT, and UIS_III for now. Get
the latest HSMODEM (v7, I think, which is where DRIVIN and SCC come
from) and upgrade your STIK to STIK2 or STing. Also, consider

replacing MACCEL34 with SilkMouse. (All freely distributable.) Once you get that working, try adding FFSEL, SAM, UIS_III and FPPRNT one at a time to see if they cause your instability. Don't add I-DRIVIN, I-SCC, or SPGDOS unless you have a specific reason to -- I somewhat doubt they are doing anything useful.

That's more or less what I have done. The "encryption" of That's Write is
just take "OriginalCharacter XOR PasswordCharacter plus constant".
Luckily, That's Write only encrypts the text part. It had not encrypted
the vocabulary that I had inserted into the dictionary :) I took these
and other words which I knew had to be in the text, used the (reversible)
encryption mechanism to decrypt the files and searched the resulting
files bye eye for patterns that resembled me of a password. Bingo!

Best wishes,

Michael

I saw the post about the Falcon on eBay Australia and saw that the
auction closed successfully at $610. I was kinda thinking around $200
NZ dollars, but maybe I'll up that a little after seeing the eBay
result for that other Falcon! :-)

Seriously, I'm jumping on a Boeing in 3.5 weeks and I don't have time
to try get the best price! Any offer might take it!!

:-)

Hi Galen,

It's been five years, but I think the reason I have I-DRIVIN and I-SCC on here (as well as DRIVIN and SCC) was because I was experimenting to see how they would do at the start of the boot sequence versus the end. I probably named them with the "I-" to mean "Initial".

So I-DRIVIN is the same as DRIVIN but at the beginning of the boot sequence, and likewise for I-SCC.

According to John Garone's reply these are from HSMODEM, and I do recall having downloaded and made use of that. I plan to follow your advice and upgrade to STik2 or STing.

It looks like I also need to upgrade my aging NVDI. I wonder where my manual and install disk is, I'm sure I've seen it since 1997... :)

Thanks for all the help!

I don't recall NVDI 3 being unstable. 4.12 is the most stable (I use
it on my Falcon), but 5.03 (the last) also works well and has more
printer drivers (I use it on my CT60). I think there is a good chance
your NVDI 3 will work just fine.

Source record: 15052

My opinion is probably worth what you pay for it, but I would advise you
to hook it all up and try it.

It is quite likely that the worst that will happen is that the trace will
trigger on the back side of the trigger pulse, instead of the front side,
and there might be some image shift to be adjusted out.

The most likely thing is that this new symbol is just a clarification of
the circuit, saying that it triggers on the falling edge of the trigger
pulse.

: to the Atari. The page:

: http://www.osiembitpower.republika.pl/serwis/atarist.htm

: Well, i would like to do the same, but using a CPC+ monitor instead.

: But. If you look at pin 2 CVIDEO Composite Video

: on the atari side, it's connected to
: 4 SINC Sincronismo

: at the CPC side.

: (info taken from http://www.museo8bits.com/mochalez/video.htm#CPC_PLUS)

: What's wrong then?

: Well, the CPC+ uses
: 1 /SINC Sincronismo

: That is, inverse sync???

: My knowledge about electronic is not very good, just a bit of soldering and
: not much more...

: What can i do then?? Is there any posibility to make it work?

: TIA

128. Advice requested for using Midi Masquerading

Newsgroup: comp.sys.atari.st
Date: 2005-01-10 22:00:06 UTC
From: Galen <atarigalen@yahoo.com>
Message-ID: <1105394406.139463.267560@f14g2000cwb.googlegroups.com>
Source record: 15054

Well, I set up Masquerading via MIDI and STing last week.

In short:
Use MIDI.PRG in the auto folder
Use MIDI, not MIDINET as the connection option
Don't add Masquerade to the ROUTE.TAB -- use the checkbox under "Misc. Preferences" instead.

However, throughput is terrible. I have 60 - 90% of pings get through, and this leads to LOTS of lost packets. Any suggestions on how to improve this?

Galen

Very nice game... except : on my FalCT60, 16 MB ST-Ram, 512 MB TT-Ram,
MagiC! 6.20, NVDI 5.03, HD-Driver 8.13, after playing a while, got a
box stating "out of memory" or something approaching (I guess this
comes from MagiC! itself). Then, I press Ctrl/Alt/Clr, and I can play
again until the message appears once more, aso.
Very boring, indeed... ;-)

> Any thoughts?
>

for those interested, the timing problem is solved.

The Midisoft sequencer clock must be set to MIDI before exporting the SNG
file to midi type 1 or 2. That setting on the Atari requires a midi signal
to the computer for the song to play so I don't use that setting. I use the
internal clock set to 140 bpm for that song so, I assume that the Atari
Mega ST4 8 mhz cpu supplies the timing signal, therefore, a 233 mhz peecee
would play it about 30 times faster (30x8=240) and a 3 minute song
(180 seconds) divided by 30 = 6 seconds which is close to the time it took
to play it before!!!

fandangled contraptions !!!

I'm guessing that you are using GEMJing for sound playback. My only guess
on this is that
I'm sending messags so frequently the the system is running out of space for
them. If you
switch to the XBIOS/DMA setting this shouldn't occur.

Hello all,

I think ive tracked down some 720K floppys, all new in boxes of 50 here in the UK.. It may have to be a bulk buy order though the prices *should* be very good. If people are interested in a bulk buy then let me know, there more buys the cheaper it should be for everyone.

Will finalize it all when I get word back (hopefully tomorrow)

Chris

I need to clear some space, so sadly I have to dispose of my collection of magazines. I believe that they are complete runs from 1 to the last published and are all in binders.

In view of the fact that I'm giving these away I feel it's not unfair of me to expect that they be collected from Watford, Herfordshire, and that the collector takes the whole collection of whichever magazine(s) he/she is interested in.

So what's on offer?

ST World
ST Applications
Atari Computing
Atari ST Review

There are a few cover disks but most were disposed of.

Email replies only, with the appropriate anti-spam measure.

Man, I remember this loser from *years* ago. Some of the replies/arguments
he (sort of) made were so lame and stale, that we used to speculate on
whether he was a 'bot set to autoreply or not.

The more things change... :-)

1) Friendly, honest, helpful and fast with service (24 hours turnaround after payment)! 2) Very knowlegeable of Atari products and skilled at helping customers choose the items that best meet their needs. 3) The inventory changes regularly and often there are many hard to find items that are unavailable anywhere else. 4) Prices are usually less than on auction sites. 5) Very huge and sorted (alphabetized) list of Atari items (old and new). 6) Ordering is very easy, no dozens of clicks on several HTML pages, just read and then copy+paste the ASCII text into your e-mail to order something. 7) I avoid making promises I cant keep!

Questions? You can E-Mail me or ask other Atari Users. You probably know 1 or 2 who bought from me. Quite a few have over the Years! (503)256-9974.

http://www.aracnet.com/~atari/maillist.htm Add yourself to my list.

Message-ID: <41e6edb1$0$19157$cc9e4d1f@news-text.dial.pipex.com>
Source record: 15085

Hi all,

I no longer have time or room to continue support for these kits, so ive
reduced prices to clear. You can buy a 1.44 kit from as little as £7!
Theres around 30 PCB's along with all related parts. if interested in the
lot then make a *Sensible* offer! Prices are already reduced!
See here for low prices, everything must go!
http://www.cps-electronics.co.uk/144/HD4.htm

Atari upgraded computers to clear also, all ST's now half price to clear.
Again taking up too much room along with monitors and other items!
http://www.cps-electronics.co.uk/surplus.htm

I also have many ST's breaking for spares, if you need a part then let me
know! I have piles of ram for the STE also. I have some 50pin SCSI drives,
sizes vary, ask if interested. Piles of games for low price, again, if you
want the lot make a offer! Theres probably more stuff ive not thought of yet
aswell so just ask

Piles of new and used 720K floppys, taking up too much room!!

Contact cps-electronics if you need anything!!!

Chris

You still need the HSModem package with STinG/STiK. The running order
should be the HSModem drivers followed by any other progs which access
the serial port. Examples are the Tabby pad and STinG/StiK.

In case you haven't already found them there are English docs for
HSModem around, including on my web site URL in sig (MISC section).

166. Are there any M.U.L.E. fans out there?

Newsgroup: comp.sys.atari.st
Date: 2005-01-17 16:21:56 UTC
From: Adam Brass <abrass@sighealth.NOSPAM.com>
Message-ID: <Xns95E172CC2B5FDabrass@69.28.186.158>
Source record: 15093

Are there any M.U.L.E. fans out there?

I am sure that a lot of you Atari ST users once had an Atari 8-Bit computer back in the day. For those of you that did, you might remember a classic game called M.U.L.E. A game that you wish would have been ported over to the Atari ST but never was.

If you are a M.U.L.E. fan like I am, you probably used to have hordes of your friends over your house to play the best 4-man multi-player game ever written! After playing this game for hours upon hours, days upon days, years upon years, finally everyone grew up or grew apart and stopped getting together to play.

If you are a M.U.L.E. fan like I am, you probably have done a bit of M.U.L.E. re-searching on the internet, in hopes for one day someone to create an internet capable version of this great classic.

Well, I have some very good news for you. If you run Windows (98/XP) operating system, THE WAIT IS OVER!!!

Thanks to the authors of the Atari800WinPlus (http://atariarea.histeria.pl/PLus/index_us.htm) and Kaillera (www.kaillera.com), you can now play the greatest multiplayer game ever made with 4 players OVER THE INTERNET! This is not a clone, it is the ORIGINAL M.U.L.E. un-modified! Same graphics, same sound, same game! The only difference is that it looks a lot better on your computer than it did on your TV back in the day!

If this interests you, please hop on over to http://atarimule.neotechgaming.com where M.U.L.E. fans from around the world have been gathering and playing online!

Some of our members include the authors of the most popular M.U.L.E. web sites such as World of Mule (http://www.worldofmule.net/index.htm) and Extreme MULEing (http://mule.eichberger.net/index.php) and M.U.L.E. Fans (http://www.100hosting.com/mule/). Even the creator of the recent M.U.L.E. clone game Space HoRSE (www.gilligames.com) has joined up with us!

Ahh, the feeling of playing with 4 human players again is quite exhilirating! SO, what are you waiting for? Join us now!! http://atarimule.neotechgaming.com.

See you there!

Adam

I'm trying to use an electronic keyboard/mouse/video switch to share the monitor, mouse and keyboard with a PC. The problem is that the Milan won't boot when I connect it to this switch, as my Milan won't boot without a connected keyboard and it apparently doesn't regard this switch as a keyboard... Has anybody used a Milan with an electronic keyboard switch? If so, what kind/make/model was that switch?

G'day, have you tried just selecting the KVM before turning the unit on?

The electronic KVM boxes are designed to simulate the signals a PS2 KB
and Mouse produces. So either one of two things is happening, the cables
are too long. Or the Controller on the Milan is not happy with the
signals supplied. Probably the latter, although from memory the ST and
Falcon do not like long cables.
I reckon you would do better with a standard non-electronic KVM box, by
the sound of it.

Yes, tried that. Even tried hacking the KVM to accept an external power
supply on case it drains too much power from the Milan's keyboard/mouse
connectors.

Dunno. You may need some libraries, but this will came out while doing
./configure, I cannot predict it.

If you ecounter linking problems, you may need to add -lsocket to linker
flags.

Thanks again Adam,

I have built this and it works fine (at least by telneting to
localhost). Didnt need the -lsocket flag, just a bit of makefile
editing thats all. BTW, do you know if MiNT uses either flock or fcntl
(or both?) for file-locking, as this was a question in the config file.
Coda.

If it compiles, it should work, as popa3d can use only library functios
(provided by mintlib) and if mintlib provides somethng - it should work.
If still uncertain ask on mintlist.

Perhaps. I got the KVM for free, so I might try to shorten the cables.
Thanks for the tip.

> I reckon you would do better with a standard non-electronic KVM box, by

Yes, I've had one of those previously, but the problem with these is poor
image quality in higher resolutions.

Source record: 15109

Hi All

I have been trying to get STeem to play my fave games - KickOff2 and Player Manager on my Thinkpad running XP. I have got Steem running but I can't get either the keyboard or the USB game pad to operate in the games.

I can set the controls in the STeem interface so I know the commands are getting to that part, but not in the games. Any ideas please?? Oh and I have TOS 2.06 image/STE 16Mhz selected.

Thanks

MG

REMOVE 'myhat' from my return email address before sending -thanks!!

That is usually a cable problem, are you using shielded cable? I have a
KVM box on my CT2 Falcon and TT. Non-shielded cable gives a disgusting
picture. Some Electronic KVM boxes actually have an amplifier for the
video signal, so it would be less critical in some cases.

I disagree. I think completely random passwords for everything are the
safest way to go. Just keep a spreadsheet somewhere (password protected of
course) with a list of them all. Here's a great place to make your
passwords at:

http://www.winguides.com/security/password.php

Maybe you need to swap the controls over in Steem ? might be one of those
options where you need to use the mouse port rather than the joystick ? I
know that drove me nuts, even on a real ST!

The original chips would either have been coded in Verilog/VHDL - or possibly even by schematic entry. In the same way you can write 'c' code to do the same job as some other software, I can write some new VHDL that performs the same. I use a logic analyser to look at the exact behaviour of the chips, and I can then run my copy against the original in real time looking for any differences.

I have finished the sound chip and almost done the MFP chip. Start with the hard stuff then everything else is downhill...
Shifter next, should take a whole half hour.....
/Mike

Now you uttered your view on him, I think he's a nice guy! Not the cheapest place to get stuff, but there's not many still supporting the Atari's, and I admire him for that! And if you hate his ads, just don't read them.

I hate spam, but mostly spam that is not relevant at all. I mean, I get about 300-500 emails a day in periods and out of those, only two or three is actual email with sense. The rest is misspelled (did I mispell or misspell that) goods. I don't mind Ben's ads here!

Now I said mine, next please!

Take Atarian care

If you do, then you will likely go to jail (or worse) and deservedly
so. You have just made a public threat of bodily harm against Ben. I
hope you never darken the venue of any such gathering. It's bad
enought that you are here in cyberworld.

>so, what kind/make/model was that switch?

I am quite sure that I have used my Milan with my Hetec V-Switch ad it just
worked - if the switch is of the electronic kind that always simulates a
working mouse and keyboard to every attached PC, it should definitely work.
The Milan TOS uses only basic keyboard functionality to detect and
initialize the keyboard.

The only possible trouble would be that a mouse wheel might not be detected
when a KVM switch is used that does not support the wheel properly.

In this day and age it would be nice if people could stop being rude and help people out once in a while.

Google is nice and everything but it doesn't tell you what sites are the best, most updated etc?

Be a part of the community and help others

Simon

Is it not a problem having the ethernet port inside the machine rather
than on the outside? I would have thought it would have been a lot
better to have the ethernet port on a ribbon cable so you can mount it
wherever you like.

I can't think of anyone who would want to leave the case off the falcon
just so they can use the network.

Simon

I don't doubt about the German Grï¿½ndlichkeit, the mailer I use (Okami)
was originaly a German program too.

Only I wished I could get it running with freeMinT/N_AES or XaAES. For
some reason I never managed to get Cat running on my setup.

Source record: 15136

I've been given the fun task of trying to find the name of a game that was on the ST at one time.

The only details I have are :-

1. It was a jigsaw puzzle game possibly with "puzz" in the name.

2. It ran only in monochrome mode

3. It was possibly a German game.

Play details I have are :-

Unlike most jigsaw games you solved the jigsaw and then could click on area's of the silved puzzle which then created a new jigsaw to do.

ie if the puzzle was that of a man with a bag you could click on the back once solved and that made a new puzzle.

If this makes any sense to anyone and could point me towards a name or an emulated solution then I'd be most grateful. I've tried searching myself but I presume it's going to turn up on one of those million and one compilation disks which I can't find a game breakdown for.

Many thanks

I've got a Wizztronics case, so its not a problem for me and others with
upgraded Falcons in different cases, but - I can see what you're saying.
Wouldn't it be fairly simple to run a short cat5 cable out the back, with
an adaptor on the end though? Just a thought.

I have that game. I was the first ST game I acquired. It is just plainly
called "Puzzle". You build the puzzle and after you are finished, the finished
puzzle becomes a piece in the next puzzle. Great game...

Hallo Martin!

MB>Only I wished I could get it running with freeMinT/N_AES or XaAES.
MB>For some reason I never managed to get Cat running on my setup.

Could you please try again with the latest version (5.42 for Cat and 2.08 for
In2Cat)? And be more specific on the problems you get if it still doesn't run?

I've not been using my FreeMiNT+XaAES setup much lately, but I did try Cat and
was able to fetch mail and news from the server without problems.

That was on my Milan040. So we've yet to see if it's a problem with your Hades,
and if so, it's your machine's fault or PureC or one of the libraries/header
files or...
Cat itself and also In2Cat should run with plain TOS and STinG also.

/rant ON

Its simple, I'm sick of helping people that wont even *try* to help themselves.. Too many people today just expect it all spoon-fed beacuse they are too damned lazy.

"hey i looked around some and want some opinions.... " would have at least been nice, and warranted some assistance..

Dont like my attitude? Wait until you get to my age and i bet you feel the same.

Dont like me at all? Fine, no one said you had too.. ignore me and move on. Dont waste my time telling me to 'be helpful'.. Ive helped more people in my life then you could imagine. But, they were all willing to at least partcipate in that help..

Be a part of the community? Give me fucking break, i was part of 'the community' when you were still in diapers. i.e. before you could run down the street, buy a prepackaged box-computer and claim ' I'm a hacker dood'.. back when you started with a box of chips and a databook and had to understand what the hell you were doing.

Before 'the community' degenerated.

Perhaps i went a bit overboard on the rant (having a bad day), but it
all boils down to being irrtated at people that dont bother to even *try*.

All i ask is that someone gives it a shot before they come looking for
help.. I would do no less myself. I ask for help only as the last
step... Not the first.

In this day and age there are so many resources to get one started. Its
not like 35 years ago when you had to know whom to ask to even get 'in'.

Is it too much to ask for people just to take a moment and think first?

Actually, I thought coming to an Atari newsgroup, posting a question asking for help, was a good place to start for someone wanting to get to know the Atari world better. Poor soul, he just forgot to wear his asbestos underwear, thats all.

224. Free in the UK: Atari ST and two floppy drives

Newsgroup: comp.sys.atari.st
Date: 2005-01-23 17:26:43 UTC
From: Ian McCall <ian@eruvia.org>
Message-ID: <pan.2005.01.23.17.28.20.138933@eruvia.org>
Source record: 15001

Hello.

I have an Atari ST (as in ST, not STF, STFM or STe) and two Atari SF354 floppy disk drives in the UK. The trouble is, I don't have have any power supplies, connecting cables or mouse to go with them. They're a little grubby too, but will clean up easily enough.

They're surplus to requirements, as I have an STe set-up as well. Was wondering whether to put them up on eBay, but the lack of cabling does rather limit their usefulness to people and a search of completed auctions suggest it's more trouble than it's worth.

So...anyone interested? Pay for postage only, which I suspect would be ï¿½10/ï¿½13 or so. Just trying to avoid junking them really - I have an inherent dislike of junking working hardware, no matter what it is.

Please let me know by Thursday 27th Jan, as they'll be heading binwards on Friday 28th otherwise.

Cheers,
Ian

I don't think so. Folks want "effort free" computing, instantly.
Just wait, the next thing is they will be asking how to get the stuff
from their PC to their ST because the PC won't format 720K drives..
And to think of all the fiddling I had to do to get 5.25" floppies to
read on my ST

> All i ask is that someone gives it a shot before they come looking for

While I agree it does not hurt to look around for the answer at first, this is in fact an Atari newsgroup. Asking Atari related things should not be a problem. So yes, If you ask me you went way overboard on this.

Personally I rather see one question too many in here, as it shows us there are still people messing around with Atari computers.

But to get back to the original topic, this is another place worth checking out for shareware:

http://users.pandora.be/tos4ever/atari/prg-ind3.htm

Ok, I'll give it a try again but for the moment I really don't have much
time. I hope I'll have some time the first week of february.

I can't recall me much details but I believe I was unable to retrieve
messages and mails. I couldn't subscribe me to newsgroups.
I also recall me slightly I had big troubles to install Cat.

Thanks for the people who has send me links with software. Offcource I have searcht on the internet, but I couldn't find Atari ST software, only pc-software.

Yes, Google is a very good searchengine, but perhaps I haven't use the good searchwords.

In the end of the 80's, there were lots of Atari software. But it looks like only Microsoft that people use. Here in the Netherlands is no shop that has hard- or software for the Atari ST.

Greetings,

Mario

Noted. Geneva and Masquerading via MIDI don't get along well. Without
Geneva I had the full 31250 bps. Of course this rather reducing the
utility of the first computer!

EtherNAT is designed for CT60 and plugs into CT60 buss sockets. To allow
other expansion in the future (SuperVidel) EtherNAT has aditional CT60
bus connectors ontop.

239. Atari clearout update 2

Newsgroup: comp.sys.atari.st
Date: 2005-01-24 09:47:09 UTC
From: exxos <exxos@home.co.uk>
Message-ID: <41f4c338$0$16576$cc9e4d1f@news-text.dial.pipex.com>
Source record: 15016

HI all,

http://www.cps-electronics.co.uk/surplus.htm

a lot more "stuff" added on the clear out page....

720K DS DD Atari Epson floppy drive.

Referbs from origional Atari machines. Tested and working. Only a few left in stock!

ATARI COMPATABLE MONITOR.

COMMODORE 1084ST COLOUR MONITOR, has Atari connections and thus shown being tested on a Atari. Good working order., case has some stickers and can be removed, but should clean up great. Has internal speaker, tested and working on Atari also. Has some stickers on the case which should be removable.

ATARI MONO MONITOR

SM124, high resolution mono monitor. Perfect clear image on screen. Good condition. Has internal speaker.

BOXED GAMES LIST

Moonwalker, Chuckie Egg, Battlehawks 1942, Falcon classic collection, Fighter Command, ThunderHawk AH-73M, F-19 Stealth fighter, Special Forces, Pacific islands, F-15 II Strike Eagle, Lotus Turbo challange 2, Knights of the Sky, Midwinter 2 flames of freedom, Empire strikes back, Damocles, F29 retaliator, The hunt for red october, No second prize, Onslaught, The killing Cloud, Hard drivin', Falcon F-16 slight simulator, D-day, Cisco Heat, Skweek, Rockin roll, Chess player 2150, Drivin force, Trivial pursuit, Live and let die, Rick dangerous, Asterix, Warterloo, Starglider 2, Falcon.. plus a couple of other boxes which seem to be "5 of the best" type games from microprose...

More stuff I've found......

FOFT(mirror image) - Fun school 2 unfer 6s - Fun school 2 6-8s, GBH manchester united - Paul woakes Mercenary I, Cascade games Disk 15, Sega archade hits ESWAT, Sega archade hits LINE OF FIRE, North and South by infogrames, Chess player, ABZoo by MichTron,

UNBOXED ORIGIONAL GAMES & ORIGIONAL SOFTWARE

SPELL IT! - FRONTIER SOFTWARE
PIPE MANIA - EMPIRE
WARE in the GULF - Empire
FLIGHT OF THE INTRUDER - mirror soft (only disk 2?)

SILENT SERVICE - Microprose
EASY TEXT 1.4A DTP - ZZSoft

50 pin SCSI Drives. will sell seperate or the lot.

Seagate ST31230 1.06gig I have 3 of those
Seagate ST12400N looks like 2gig ?
Seagate ST32430N looks like 2.1gig ?
Quantum 2gig drive

Also is a 4.3gig Compaq drive though its SCSI-3, but has a additional adapter to convert to 50-pin.

All were tested about a year ago on my Falcon 030 so assumed to be working (I would have chucked them out if found to be faulty, though sold as untested)

No reason not to use them on a PC either!

NEW ATARI CASES

I have about 8 NEW atari cases (top and bottom plastic) for STFM and STE

ST FORMAT COLLECTION - the lot only.

Not origionals but copies, all the disks seem to be there in 4 draw type disk boxes. 4 boxes in total so must be around 200 floppys.

MAGAZINES- will sell seperate or the lot.

ST USER, 75, 79, 68, 86, 102, 55, 66, 106, 103

ATARI COMPUTING, 3,4,5,6,7,8,9,10,11,12,13,14

ST FORMAT, 84, 80, 79, 78, 72, 71, 11, 10, 9, 8, 7, 6, 5, 4, 3, 2, 18, 17, 16, 15, 14, 13, 12, 70, 69, 34, 25, 23, 22, 21, 20, 19

ST REVIEW, 32, 33, 11

MORE COVER DISKS - will sell seperate or the lot.

I have origional cover disks (I dont have them all) from STformat, STreview etc etc, will list them as I find them.

ST USER - aug 1989, july 1993, may 1991, dec 1989, dec 1991, june 1991. July 1990,

ST REVIEW, 7 (1&2), 6(1&2), 10(1&2), 26, 19,6(2), 11(1&2), 18,9(2), & no number on front, but has a image of a god on front.

ST FORMAT, 58 ,79 ,59 ,19 ,7, 34, 8, 9, 20, 47, 18, 16, 14, 5, 4, 1, 2, 6, 12, 11, 84, 23, 25, 28, 32, 33, 35, 36, 37, 38, 39, 40(1&2), 44,52(1&2), 43, 39, 57, 78, 80, 21, 48, 17, 15, 10, 1, 9,13, 35, 44, 45, 38, 47, 32, & 6 other disks with no number on (GFA, Write on, spec 512) 50(NO), 12(NO)

ST & AMIGA FORMAT - PC EXPRESS- 1, 2, 10, 5, 7, 4 1

DSDD 720K floppys with software, mostly PD box of 25, sold as used floppys with software, or sold as for blanks. Includes 25 formated blank used PACK 1.

DSDD 720K, used but formatted to prove are OK. at least half with no, or new blank labels, Box of 50. PACK 2

DSDD 720K, used but formatted to prove are OK. at least half with no, or new blank labels, Box of 50. PACK 3

Also new boxes of 50 on the surplus page!!

Falcon 030 HD PD - FLOPPY SHOP. will sell seperate or the lot.

FALC -7, 4 3960, 4406, 5301, 4862, 5419, 3983, 5509, 4458, 3960, 5890, 5231, 28, 5524, 2, 4864, 4782, 5687, 5153, 5907, 4366, 4399, 5343, 5342, 5834, 4863, 5083, 5022, 114, 3984, 4089

MUS 3607

LAN (DSDD) 4943, 3612, 4928, 4648, 4839, 4929c, 5334,

DEM (DSDD) 4926C, 35C, 3472

We have many Atari ST/FM/E's breaking for spares. If you need a part E-mail us with what you need!

I keep finding stuff, so as I find it (and have time) I will add it to the list here.

---

thats about all for now, keep checking!

Chris

Why not try in a good place to look rather than a poor place to look ? An Atari newsgroup should be good as teh good folk here know the scene. Google doesn't know anything and can only spew out website addresses which may not be supported anymore. I'm finding it harder to find things on Google because there are so many websites out there and only some are relevant to what I want.

If you don't want to help out, you don't have to !!!

> In this day and age there are so many resources to get one started. Its
> not like 35 years ago when you had to know whom to ask to even get 'in'.

Last time I looked through Atari websites on Google, half of them had links that didn't work and some sites seemed to be down.
What's wrong with asking someone that should know instead of wading through crap ?

Steve M

242. Anyone got the Page 6 ST Library Catalog Disk?

Newsgroup: comp.sys.atari.st
Date: 2005-01-24 21:05:52 UTC
From: Paul R <prixon@#NOSPAM#lycos.co.uk>
Message-ID: <41f5632e$0$45310$ed2e19e4@ptn-nntp-reader04.plus.net>
Source record: 15019

Hi

Does anyone have a copy of the Page 6 ST (public domain) library catalog? It was orginally published in printed form and later on disk. Ideally, I'm after a late copy of the disk version if possible.

Many thanks if you can help.

Paul

Before i commented i also did a search, and the first 3 hits were live,
and had files.. they also contained links to others..

While i mentioned it in another thread, its not that i dont wish to
help, i only ask that people do a little homework first..

I even tutored in college and highschool.. And those that would try id
drop.. Ones that did try.. id help until 2am....

So i guess thats my 'old school' teacher instinct kicking in..

(i do the same at work.. if someone tries.. but still doesnt catch it,
ill go out of my way for them..)

But this is being beat to death..

Whoops it appars im wrong, though i cant read German.. it does say OSX
on their main page.. I can read that much at least.. So ignore my 68k
comment.. im all wet on that one.

Though, i wonder how its gonig to run *any* traditional TOS/GEM apps
when they are compiled for 68k but your cpu is a PPC..

I'm not some kid who only knows the name Atari from a cool tshirt. I've
been an Atari user for many many years and I've taken part in many
things from magazines, user groups, conventions, programming, music all
done on the Atari.

All I am saying is help people that need it, instead of telling them to
help themselves. Want to save what little of the community is left then
be friendly to new people.

Simon

Hi, Ziggy!

Z> Though, i wonder how its gonig to run *any* traditional TOS/GEM apps
Z> when they are compiled for 68k but your cpu is a PPC..

The main difference between MagiC Mac and MagiC Mac X is that the latter has to emulate the 68k CPU while the first could use the 68k CPUs of the old school Macs or the Mac OS 68k CPU emulation (which has been abandoned with introduction of Mac OS X).

Regards,

Alexander

Hi there,

If you are reading this Austin please can you email me urgently at...

blobster_nz<AT>hotmail.com

I've tried emailing you at austin<AT>webaxs.net 5 days ago, but have
yet to
see a reply. If that email address is incorrect please email me
advising the
correct one.

I need to get your confirmation that you still wish to purchase my
Falcon030,
and once you confirm that is still your intention I need to ship the
machine
ASAP as I have only 6 or 7 days left before I leave New Zealand (I
cannot get
anyone left here to arrange the shipping, nor can I take it with me to
Brisbane).
It is ready to ship, and as soon as you confirm I will send it and
arrange with
you the payment details...
Kind regards,

Chris Wilkinson, Christchurch, New Zealand.

MagicMac is a fantastic emulator I have use during near 10 years, this fast, robust with resolution of the mac near perfect except no real FPU emulate. This is for classic version running correctly on MacOS <=9.1 (I think on 9.2 it doesn't work), in all case it doesn't work if run with the classic emulation on MacOSX.
Now there is a version for MacOSX, the only demoversion I see, it's slow, and far from classic version. Now this demo is very old I don't know if progress was done in final version.

There's also no FPU emulation (with MagiCMacX), nor is there any sign of
any ability to access Ethernet on the Mac side - something that I would
have expected to find added since the OS 9 version.

One of the biggest annoyances is the way that the Dock gets in the way
when you're working near the bottom of the screen under MMX :-(

Hallo O.L.,

O>This is for classic version running correctly on MacOS <=9.1 (I think
O>on 9.2 it doesn't work)

With 9.2.x MagiCMac runs very fine!

O>the only demoversion I see, it's slow, and far from classic version

Yes, MagiCMacX is slower than MagiCMac. The EMulator is now in MagiCMacX
and is not a JIT like in the MacOS Classic, but an interpreter (written in
PPC-Assembler, but an interpreter).

Source record: 15035

My Dad used to love the Rage Software footie game, Striker. Something of a love-hate relationship, because he would swear and curse at it, but always return to it.

Anyhow, the disk became unloadable, and he chucked it before I had a chance to try to recover it. It must be the Rage version - there's another Striker, which I believe is a different game.

Can I buy this off anyone? I've kept an eye on Ebay for a few months with no luck. It's his birthday soon, it would be nice to find it. I'll pay a fair price of course.

Remove the "NoSpam" if emailing. I am in the UK by the way.

Geoff (an old [in all senses] assembly language Atari ST programmer)

I know someone never be able to run it on this system, but perhaps on
OSX with classic I'm not sure, ASH said him to take OSX version. thanks
for this information.

version.

As far as I remember the demo version is the version 1.0 which is
rather unstable.

The next version (1.1) is pretty stable, but I did not create a demo
for this.

The current version is 1.2 (from December 2004), but there is no
official announcement, yet, and I do not know, if you will receive that
version in case you buy it from ASH.

Hi Ziggy,

>Sorry for being a bit OT, but how in the world did you find a
>STBook?

I bought it in the days that Atari was still running a company. I paid
about the usual marketprice of these days and am still very happy
with it despite the fact that i hardly use it anymore (there's only 1 Mb
RAM in it...)

But sometimes you will still find them on Ebay where the same
price as then is sometimes offered.

>I also think that 'MagicMac' is only for 68k mac's.. Not PPC
>based...

I thought that the latest version where adaptive to PPC. I'll find it
out.

Thanks,

How do you know when peop's have done research or not before their coming
here?. I know google can be your friend but he can also be a complete
barstard when you need him most.

Maybe its best to assume that the OP feels at home here and would ask his
friends before going elsewhere.

268. Atari-formatted DD disks on PCs again

Newsgroup: comp.sys.atari.st
Date: 2005-01-28 22:53:11 UTC
From: xlator@cix.compulink.co.uk
Message-ID: <ctefonlqk1@thorium.cix.co.uk>
Source record: 15045

Hi!

I thought that DD disks formatted on Ataris with TOS >1.2, or with most other 3rd party formatters (or after the use of a boot sector conversion program) could be read by all PCs running Windows. (In fact I wrote as much in reply to previous discussion on this topic.)

However, a friend of mine for whom I converted a TOS 1.02-formatted disk to an IBM boot sector tells me that his office, which is entirely Windows 2000 based, can't open the DD disks - in fact apparently can't open any DD disk!

This is strange, because XP opens the disk fine (though can't format DD) and it can be opened and formatted on earlier Win versions like 95 and 98. I wouldn't have thought that M$ would skip out a generation like that...

Can someone please confirm this? Or is my friends office running some sort of firewall or virus killer which barfs at disks with 'strange' boot sectors, such as IBM-style DDs?

Regards, /Peter/

Format the disk on the PC, it'll be fine.

To format a DD disc under XP don't use the silly windows format gizmo.

Open a command prompt and type the following and press enter:

format a: /u /t:80 /n:9

Just wondering, wanted to make sure, but...

pin 1 (power) on the cartridge port on the Falcon is the far left pin, correct? (looking at the machine from that side). That would be closest to the back plane of the Falcon.

Thanks all.

Real problem is that Atari's built in format uses 5 sector/FAT instead 3
by PC's DD disk format.
It stays even for latest TOS 2.06, contrary to some writings.
Atari is flexible, and accepts various formats, while PC expect only
predefined formats.
```

Ah, that may indeed be the problem. But in that case, why does it
only affect Win 2k and not 95/98/XP?

Thanks Egon!

Except that I don't think the Win 2k computers offer the option of
formatting DD disks - not sure as I haven't seen the installation.

>To format a DD disc under XP don't use the silly windows format gizmo.

No, they were standard 80/9 disks - otherwise they would not have
opened under XP!

>I suspect more likely they have some odd drives that only do HD. Not those
>nasty USB floppies are there?

Don't know, but doubt it, as the installation is some years old
(would be with Win 2k!) and I think predates USB floppy drives.
I'll ask next time I contact my friend or go to his office.

THE ATARI TIMES ANNOUNCES THE AVAILABILITY OF THE 2005 COMPENDIUM
January 31, 2005

For immediate release:

WINTER HAVEN, FL - The editor of The Atari Times (www.ataritimes.com) has announced the completion and availability of the annual paper-based book titled the 2005 Compendium. Copies are now available for sale at www.cafepress.com/ataritimes.

The book is 102 pages of news, features, reviews, and previews for all Atari home systems that have appeared on the website over the 2004 year. These include articles for the Jaguar, Lynx, 7800, 5200, 2600, home computers, and even the arcade systems. In addition, the 2005 Compendium includes 45 pages of previously unreleased material and a beautiful full-color cover.

Gregory D. George, editor and writer for The Atari Times commented, "The theme for this year is, 'Where it all Started.' Certainly, Atari is the reason we are all enjoying video games today. This is a book that celebrates the introduction of Atari and video games to the world."

"This was a fun book to put together, even more so than previous books, because there is a huge amount of new content. Some of the best new material includes a chat with famed Jaguar playtester Lance Lewis (who reveals the secrets inside of Tramiel controlled Atari), TAT's Top 10 Consoles of All-Time, Atari at the Ballpark (covering Atari baseball games), a reminiscing of Atari titled 'Antique Electric Dreams,' an exclusive review and play test of the Atari 7800 Cuttle Cart 2 (which is thankfully back in production), pages and pages of new 2600, 7800, Lynx, Jaguar, 8-bit, Atari ST, and arcade game reviews, and much more."

"The quality of 2005 Compendium is better than ever because it is printed through CafePress.com instead of at my local print shop. I'm very pleased with the high quality job CafePress.com offers," said Mr. George. "We also have some great sponsors of the book this year and I'd like to thank Songbird Productions, Good Deal Games, Orphan Video Games, Video Game Connection, and Packrat Video Games for making it possible."

>From January 31, 2005 to February 7, the price of the 2005 Compendium is $13.95. After February 7, 2005, the price will be $14.95. Shipping charges also apply.

More information about The Atari Times Compendiums can be found at http://www.ataritimes.com/store/books.html. To purchase any Atari Times

book, go to http://www.cafepress.com/ataritimes

The Atari Times is a web-based publication devoted to all Atari game systems. Updates to the site are on a weekly basis. Visit http://www.ataritimes.com/ for Atari related news, previews, reviews, and feature articles.

Hi all !

It took me some time to achieve this, but here they are : the source code of VISION and FRACTALS (partially due to a crash...) are available on my web site !

Do not hesitate to have a glance at them and if you like the idea to continue the development, go for it !!!

Now, VISION is completly free, the tool to generate the registration key is also included.

Thanks for all the support you have for VISION during these 12 years !

If you do something with this source code, leave me a message, it will always be a pleasure !

Have fun !
Jean

I think we are mixing up two separate differences/incompatibilities
between TOS and DOS floppies.

The one that was fixed in later TOS versions was the boot record, mainly
the wrong media ID. Without a valid media ID you can't read a TOS disk
under any DOS or Windows version. This can easily be fixed anytime, even
when the disk is full, just by rewriting the boot record.

The other one is a different FAT size. This can't be (easily) fixed once
the disk is already formatted, because you would need to move all data and
directory sectors.

This was never a problem under DOS or older Windows versions. You can read
a TOS 5 sectors per FAT disk. I think this was never a problem under Linux
as well. It seems however that this might be a problem under Win2K/XP.

Well, as I said, late-Atari-formatted DDs read OK under XP, so I
would have expected 2K to read them as well.

I am rapidly coming to the conclusion that, as Adam suggested
earlier, it may be that the drives used in that office are the
cause, rather than the OS. I must say that I didn't expect any
maker to drop support for DD disks in drives, but I suppose it
saves a few cents not having the second hole sensor or having to
switch step-rates.

Regards, /Peter/

Hi Steve,

I hate to go into panto mode, but I just feel an "Oh no it doesn't" coming
on. If you want a command prompt to format a disk the "CMD" and "command"
are interchangeable. But that does not mean they acheive the same thing.
Just try both "cmd /?" and "command /?" to see the different options and you
will see "command" is different. I did see a help entry ot technet article
that explaind the differences, but I can't find it right now!

Yours Anally Retentively,
Dave.

With FTP-Serv 1.09, I can't assign multiple units ; for example,
toto pwd c:\ 1 d:\ 3 g:\ 7 doesn't work : when I connect from the
distant machine, I only can view g:\.
I tried with U:\, but then some folders are unreachable (access denied,
or something else weird I can't remember).
I'm running MagiC! 6.20 / Thing, if someone knows how to...

TIA,

J.-Luc

There are a variety of programs that can do this. I still have a
freely distributable one that can go up to 999KB. I think it was
called XRAMA000, where "A" was the drive letter and "000" was the
number of KB. Let this group know if you cannot find it.
The Codehead Utilities could go much higher.

I know one doesn't require a screensaver, but I've rather liked giving the computer something interesting to do when it's not in use. Unfortunately...

Twilight occasionally turns the screen black and refuses to wake up, requiring a reboot. I suspect this is a bad module, but I can't seem to narrow down the problem. It doesn't help that I don't understand much of the German.

Screen Artist used to work fine (although it would sometimes take quite a few seconds to finish drawing something before waking up), but recently it occasionally stops the computer from responding to mouse or keyboard input.

Obviously both a refusal to wake up and a refusal to recognize input are not acceptable behaviors in a screensaver, so hence my question?

If you are using a screensaver, could you comment on your choice, its strengths and weaknesses, and what settings you do (or don't use)?
Galen

The Intersect Ramdisk (that if I remember, came with Interlink the old
terminal proggie) was a desktop .ACC that allowed one to use as much RAM
as you could extract from the system. Even better, it was instantly
configurable. Try a google on it.

Hi Galen,

My absolute favorite is Idlewilde(if I've got the name right). It's small and simple to use.

It's the spinning fuji symbol which changes colors, on a field of stars which also changes colors, and as the fuji gently bounces of the sides of the path, it temporarly erases the stars along its path.

I have it set to 'wake up' via the mouse and/or keyboard.

Also, has no problems running on my falcon/ct60.

Have a great day!!

You can use RDE. It can create a ramdisc of that size[0], that survives a reset and the disc can be saved to disc complete with all the contents. You'll probably find the full archive on one of the FTP sites, i.e. chapelie.rma.ac.be. If you can manage without the documentation, I have an archive of just the program and .RSC file. It's a whole 12k long and presently located at:

<URL:http://www.davjam.org/files/rde.zip>

[0] I used a 2Mb ramdisc for a while when using a 4Mb STE as my sole net machine. It was used to hold STing, CABs cache and a few other things that I can no longer recall. AFAICR, I created it, filled it with the bare necessities, saved it to floppy, emptied the ramdisc, copied the saved image back into the ramdisc, packed the image using PackIce and then copied the packed image back into an auto-folder on a floppy.

Regards,
David Bolt

I use bubbles, it floats bubbles with a blue outline and white
highlights up a black background but I can't remember where I found
it. There is another screensaver also called bubbles which may or may
not be an enhanced version the one I use but it did not have the
bubble effect and I did not like those that came with it.
Its a very simple screen saver the only settings to really bother with
are the minutes the computer has to be idle before it blanks the
screen, wake time is fast and I've never had any problems with it
although I can't remember if it works in all three resolutions.

Magic(Mac)(X) supports a loadable keyboard table (a binary file) that
even may contain "dead keys" (since 2002). They same should be true for
MiNT (just guessing), so it might make not much sense to patch old TOS.

Twilight and Screen artist does give me problems too. Right now I'm
using Bubbles. To be honest, there are some modules which seems not to
work very good on my system but most of them works just great.
Give it a try. Unfortunately for you, the docs are in German but it
comes with a English rsc.

<URL:ftp://chapelie.rma.ac.be/atari//utilities/screensavers>
Look for bbls30.zip.
On that directory there are some other screensavers too.

Website of Bubbels (German):

Hiya

Q: Where can I download Magic or MTOS 4 Atari Falcon ?

I'm a complete newbie when it comes 2 Atari platform so I gotta ask. :)

U could also explain a difference between the two if it's not 2 much of a trouble.

Thnx.

Thank you all for your answers, i found one named UMRAM, which let's you configure as much as you have (4Mb in my case), but it don't survive to reset.

I'll try those you said, and keep what see best

Thanx again! ;)

331. CT63

Newsgroup: comp.sys.atari.st

Source record: 14908

This is the name of the CT60 third production !

This CT63 will be a LOW COST version of the CT60 and I asked to the factory to give me a price without all components that can me removed on the board (not implemented).

The CT63 will be so :

- Price betwen 220 to 250 EUR with the 060 (full) : depending on the number of board that may be produced !
- no 060 socket : the 060 will be soldered (after tested) on the board (will get more space under the keyboard).
- heatsink will be stucked on the 060 and a fan will be fixed (plugged) on the heatsink (size of heatsink = 45*45 cms).
- the CPU & SDRAM clocked at 50 MHz instead of the 66MHz (OSC soldered (no socket) = can be unsoldered to try to boost).
- no boost of the motherboard (components not present = could be added by the user if he can find and solder them !).
- no temperature captor (it is a gadget because get more than 10 deg C of unprecision !).

This time I have 14 orders and I'd like to get 40 orders.

Let's go atarians ! It is your last chance to join the Falcon 060 world !

To confirm, please, send me an email if you want to buy between 220 et 250 EUR.
After we will see...

PS : $/EUR ratio is decreasing these days...good for some people...

Please spread this message on all atari user sites !

R.

Magic is commercial. MultiTOS is obsolete. If you have the goal of multitasking without much expense, MiNT is probably what you want to try. See http://freemint.de/en/ for more information.

I think it would have been schematic entry, it was popular back then.
Also, the ST prototypes were built with ordinary TTL logic IIRC.
Probably only a coupel of these in existance.

Message-ID: <5ZLMd.170$UX3.23@newsread3.news.pas.earthlink.net>
Source record: 14914

Hello,

RJH> Given that you can't even find any 68060 CPUs any
> more, what is a good, average price for one?

I couldn't find one in my electronics catalogue, so I broke out Google (and Froogle). Here's an example price...

http://www.amiga.ca/catalog/product_info.php?products_id=28

...presumably that's in Canadian dollars.

I could be wrong, but I vaguely remember that a 50 MHz '060 is comparable with a 25 MHz '040, since all 68040 chips were clock-doubled, but Motorola didn't make a marketing ploy of it until Intel started doing that with things like their i486 DX-2 50 (2x 25MHz), i486 DX-2 66 (2x 33 MHz) and i486 DX-4 100 (3x 33MHz ;-)

You could also look at 3.3V 68040 chips if your accellerator will take those.

Hope this helps,
- Andy Ball

Galen I use Twilight and enjoy it very much. True now and then it turns the screen black, but that rarley happens in my case. Most of the time it is right on. I use it on a Hades, so I get the brillant colors and the speed. There were ones that would crash the computer, so I finally narrowed it down to a chosen few that work.

Same with me. I can connect to only one partition at a time, but they are all accessable. I have it installed on my STe and I use my Hades to connect, so I download the STe's files for backup to a CD.

It dont fit, the height of the fan on the heatsink is too much to fit under the keyboard. I didn't know that until I brought one! Though thats why CETEX was developed which moves the CT60 further back. Not tried to put the top back on my falcon yet though cos ive gota wire in some switches yet, but it should all fit in.

That's bad info !

CT60 fit under the keyboard with the big fan (the first batch of CT60) but
the fan must no be plugged on the heatsink...
It must be put just near to flow on the heatsink...

I did that here !
So why couldn't you do that ??

CT60 fits in the falcon case and the keyboard is OK on !

That's kind of strange. I went to gim.atari-source.com and clicked download and downloaded any one of the 3 archives available and it worked perfectly? Speaking of, the GIM that is available there hasn't been updated for a very very long time. I'm waiting to make a release until I figure out why it's no longer working with xaaes. If you use N.Aes it'd be best to do a CVS build and compile it yourself.

Thanks,
Mark

I notice you were talking about MagiC too. Because of dependant
libraries, GIM can work under MiNT only.

Thanks,
Mark

Whilst I have your attention Andreas, I have an English translation of
the MagiCMacX loader and the update readme - I'll put it on the web site
with your permission.

I see that ASH are still only offering the 1.1 update; will it be
possible for me to get the 1.2 update from yourself please?

Set up a user for each partition.
rootc pwd c:\ 1
rootd pwd d:\ 1
roote pwd e:\ 1
Etc....
Then login to the partition you want based on your chosen user names.
Personally, I name my partitions like so.
tonic, supertonic, mediant, subdominant, dominant, submediant,
leadingtone
I, ii, III, IV, V, vi, vii, I
And so on...and rather than thinking of it as a 'username' I consider
it partitions.
Any sorta naming scheme you like will work.

Also, when using drive u: under ftpserver & MagiC, I find it imperative
to have a floppy in drive a, and rename drive b to .b, otherwise that
quiet search for a disk in the floppy drive a can really freeze things
up.

I also find that using drive u: and MagiC/FTPserver is fine with some
clients, and not so kind with others.

I thought I read that the *68060's* were internally double-clocked, so that while the marked MHz rating and external clock speed is 50MHz, the chip inside is actually running at 100? I may have misread what they were saying, but I know that this was refering to the 68060. They called it "superscalar". The 68060 was the first to have that, according to Motorola's site, if I read it correctly. Then again, I may be completely mistaken... It's been a while since I read it. I'll have to go find that again sometime and check.

355. Which TOS to switch with 2.06?

Newsgroup: comp.sys.atari.st
Date: 2005-02-05 04:53:46 UTC
From: Egon Spengler <Egon@the.lab>
Message-ID: <HOudnctwG5r5zJnfRVnysA@eclipse.net.uk>
Source record: 14932

Hi folks,

Just bludgeoned TOS 2.06 into my Mega ST and am wondering if it's worth putting another TOS in there to aid compatibility for old games etc?

If it is worth doing, which other TOS would the panel recommend?

Seeing as there's another 4 spare sockets, i could switch another 2 TOSs in i guess, but that seems a little overkill.

TIA

Egon

Yes, there are original HD drives for the Atari ST. It seems that Epson has made some drives.

I don't know if a pc-floppydrive works in an Atari ST. Maybe the frontplate of a old Atari drive can use on an pc-drive.

You can't use the old Atari floppycontroller. There must be an Ajax floppycontroller.

Greetings,

Mario

Superscalar means that in one clock cycle, CPU executes 2 instructions.
That would mean something similar as "doubleclocking". It is not
doubleclocking, but internal arhitecture to allow executing 2 or more
instructions per clock cycle. I did saw some comparisions and 060 with 2 or
even 2+ instructions per cycle was on top of the list, i think P4 was 1.8,
etc. Of course P4 uses RAW power of many MHz. But i must say, that i can
also be mistaken here :)

I use a reset proof ram disk on on my Mega4 that will give
a max of 2 meg ram and drive letter is selectable.
It will not survive a reset if the power is turned off but will
survive a reset using the button at the rear of the computer.
If you're interested, E-mail me at the address of this letter but
remove -NOT- from the address.

.. than-you too, Brian!
I was mistaken by the sample file that means to allow many drives for
one single user. Maybe a /todo/ which has been abandoned ? :-/
I solved the problem of drive a:\ access with a little utility to be
put in the Start folder : DELU_A_B.

Thanks again to both of you,

J.-Luc

At the time I posted, all the tries I had done had turned to continuous
connexion loop (CAB, HW, but also tried from a PC with IE), or
redirection to a page stating I don't remember what about non-existing.
I tried right now, and at least the link above works.
So I assume it was a server or networking problem : next time, I'll
wait before posting for help :-/

366. GIM v0.3 Released!

Newsgroup: comp.sys.atari.st
Date: 2005-02-05 21:32:58 UTC
From: Mark D <mducksub@nosspamatari-source.com>
Message-ID: <pan.2005.02.05.21.32.57.714157@nosspamatari-source.com>
Source record: 14943

Hello everyone,

I really tried to get this done by Xmas but I failed. Oh well. Anyway, now you have a little bit of after xmas fun! Gim version 0.3 has been released. This is still alpha quality but is approaching beta quality. It shouldn't destroy your machine or anything. This software is licensed under the GNU GPL and the source code is available. For those that don't know, GIM is short for GEM Instant Messenger. It is an increasingly full featured AOL Instant Messenger client for Atari compatible machines. It currently and for the foreseeable future only works under MiNT on XaAES or N.Aes but assuming someone wants to do the work, Magic support is possible. It also requires MiNTNet networking rather than STiK.

For those who haven't used a CVS edition of GIM since version 0.2, there's quite a few surprises in this release. GIM is much more stable, staying online for days and days subject to the stability of aim servers and your network connection.

Now, here's a list of all of the changes since version 0.2. This list may be missing some things that were actually done.
* Bugfix in the preferences dialog
* Disclaimer removed. It looked awful anyway. The logon dialog was changed.
* Killed all the debug messages in the release version.
* Click on a buddy in your list to start a new conversation!
* Full configuration system stores buddy list modifications inside acct1.blt, and stores full font and window configuration in gim.cnf. Your window size and position is remembered! I wish all programs did this :)
* XaAES fixes (some menubar bug yet to be addressed)
* Wordwrapped scrollable buddy info.
* Set your own Buddy info.
* Beginnings of Away message implementation.
* Proportional fonts in conversations, user configurable mono-spaced fonts everywhere else.
* Several key stability improvements

Upgrading? Copy the new gim.prg and gim.rsc into your current gim directory. Keep your current acct1.blt or use the included one (xevaporated and nsxwolf are me.. Say hi :)), DELETE your current gim.cnf. It won't work and this new version will create a config file for you.

The config file is user editable if you don't change ANY line or word spacing. The GIM config parser is VERY dumb :) It's intended only to be adequate.

If users would like MagiC support, some nice person with some time and expertise must convert libfaim to be working under MagiC. This means depending on mintlib and the other dependent libs to not require the mint kernel. This could be some work! After GIM works in MagiC with MagiCNet, I would be willing to do the work to make GIM work with STiK.

Download at http://gim.atari-source.com under the downloads section. Good luck!

Thanks,
Mark

Hi all,

I cut my teeth on an ST years ago and I'm recently (for reasons that arent exactly clear to even myself) trying to 'recapture' what I failed to achieve all those years ago (primarily from an educational perspective).

I'm attempting to track down as much info as possible on the following ST issues

BBS software (does anyone still have any?)
A weather satellite receiver kit (seen in an issue of ST format) - obviously this had hardware so I really just looking for info (manufacturer?)
Teletext decoder (again seen in ST format) - again this had hardware, again this mainly going to be info

All of my searches thus far have not resulted in anything concrete (I even looked at getting a bunch of ST Formats that were on ebay but unfortunately I missed the opportunity) - I'm guessing this stuff is kinda old for google (since it didnt have anything relevant) and the day of the [non-porn] BBS is probably over :-(

As an aside are any of the old public domain libraries still going? (seem to have recollections of one called Dominator or something similar, their logo was a super hero type of character)?

Appreciate any assistance

Can't help. Google wefax. There was, at least recently, an interest group
on the subject, with a magazine out of England. The problem is an Atari
wefax display program. One was started, and abandoned, for lack of either
a market or a good programmer. Ask them.

Google Octopus, which seems to be a new BBS software, which also runs on
Atari-based internet BBS.

Teletext hardware should be platform independent, I think.

If you are really looking for help, a valid e-mail address might be
useful. It does not seem useful to help nobody nowhere.

Ok, but for those of us who still choose to use "old" TOS? I, for example, still look for a replacement DMA chip to use hard disks on my STE, so the only usable storage media I have are floppies. Loading an alternate O/S from disk would take too much time for my tastes. (I even find devpac slow, so I use Turbo Assembler :)) So, I have to stick with patching old programs (besides, it's fun in a twisted sort of way ;))

Thnx a bunch .. .I DL-ed Mint 1-16-0 and it " seems " 2 be working .. the only thing I cannot seem 2 acomplish is making it boot in some sort of GUI environment.

I have a bare Falcon 030 with 4MB ram and a floppy disk drive. I'm tryin 2 aquire a HDD but it's a plan in progress..

Any suggestions ?
I've read the readmes and all and I know I'm supposed 2 edit the .CNF file(s) butt whatever I do .. the results are the same. MINT#: prompt is all I get.

373. Atari VME connector

Newsgroup: comp.sys.atari.st
Date: 2005-02-06 15:53:23 UTC
From: Jim DeClercq <jimd@panix1.panix.com>
Message-ID: <cu5ehj$rp1$1@reader2.panix.com>
Source record: 14799

Typing this twice. Invalid address. Somebody somewhere asked if a particular number was the connector for an Atari TT VME bus, and left out a digit.

VME was Versa Module European, until the US M1 tank used it, and then it just meant VME, and the single connector version got known as Eurocard.

Looked this up in a Newark catalog. DIN 41612 Eurocard Connectors do come with three rows of 33 pin positions, and the plugs do list a mating Type B.

Catalog is a couple of years old, 119. Pages are 125, 275.

The answer to whoever asked this is a quite probable yes.

Ummm. I do appreciate all the work the SpareMiNT team has done. But I alone, so far, have the idea that the approach chosen for version 1.16 was mistaken. Some extremely experienced people tried to make an autoloading version of MiNT, for new people, and probably me, and aimed way too high.

I would recommend EasyMiNT, which loads 1.15.12, and is easy to follow. It will set what you boot to, and also load Xaaes or N-AES. The AES configuration file loads a desktop, and Thing is a good choice. Teradesk works adequately, moves very large groups of stuff faster, by taking bigger bites, but occasionally, in doing that, loses the program flags from program files.

N_AES is a good choice for a aes, which you will need. It is expensive, but I cannot get it to do anything unexpected. I did have a problem with the CD distribution. It reads correctly on the oldest CDROM I have, with the latest drivers available, Extendos. Any other combination, and some files were never there, or were intermittently there, and it would not load directly from the CD. The CD is OK, but it may not match your read setup.

EasyMiNT also comes with adequate documentation. If you do not know how to do something, the documentation is there. You should print it all out, punch holes in the pages, and put them in a binder. For a while, you will need this.

I believe that sparemint.atariforge.net has the EasyMiNT distribution, and is reachable by ftp as ftp sparemint.atariforge.net. If not, google easymint, and its author's site will be in the google list. I think it can be found in three places, and you should find one.

Someday I will try version 16 again, but I suspect I am stuck with version 15, which allows fast switching between TOS and MiNT. I need and use both, and find both convenient.

When I do not have MiNT running (a long series of short lived small hard drives for an external drive box from E-Bay) my machine is not complete. MiNT is very convenient when it works. That is a matter of personal opinion.

The current version of FreeMiNT is 1.16.1
(http://sparemint.atariforge.net/sparemint/mint/kernel/1.16.1/) There is
a readme that explains how to install is (along with GUI, that is Xaaes).

Unfortunetly, 4MB is not enough for a decent GUI with FreeMiNT. Get 14MB
Simm adapter (I reccomend Czech ones, as they are 25MHz tested).

Lets cound it:

FreeMiNT kernel - 1MB
Xaaes - 1MB
decent desktop - 1MB
andf some mor - 0.9MB ;)

4MB is just not enough these days.

At last I would reccomend signing up for CT63, where you can put up to
512MB of RAM :).

One more quite important q: Is there any HYP reader that runs under windows
?
I aquired some documentation on the subject, but it's in a hyp format (?)
and I can't read it normaly under MS Word or similar.

I found something called HYP Viewer but 4 Atari . . and since I'm doing all
the reading on my PC .. it would be much easyer 2 have a viewer 4 the same.

Thnx!

Message-ID: <42069a15$0$15909$cd19a363@news.wanadoo.nl>
Source record: 14809

When you are using an older Atari ST, such a 1040STf, then you can't use floppy that are formatted on a pc. It seems that the floppydrive can't read every floppy.

The newer ST's, such the Atari 1040STfm can read Dos formatted floppy with the command:

Format a: /u /t:80 /n:9

An external floppydrive can maby help to read Dos formatted floppy's.

I don't know how much people are using a real ST. A ST is very cheap, but you've got problems when you are having friends with a pc. You can't even share MID files when you are having an older ST.

I'm looking for a hardwaresolution, so i can use my older ST a long long time.

Greetings,

Mario

384. Third edition of Atari-Day in Dordrecht, be there!

Newsgroup: comp.sys.atari.st
Date: 2005-02-06 22:49:51 UTC
From: "Ernest R. Schreurs" <ernest@wxs.nl>
Message-ID: <536d01pf8e10tms5fi2ijpthoc9e8p18vr@4ax.com>
Source record: 14810
Cross-posted to: comp.sys.atari.8bit,comp.sys.atari.st

On sunday the 13th of february 2005, the third edition of the Dutch
Atari day will be organized again in Dordrecht, The Netherlands.
The location is the Titus Brandsma-Stedelijk Dalton Lyceum.
Kapteynweg 3
3318 EC Dordrecht
The Netherlands
The event will be held from 10:30 am until 16:30. Admission
is free. It will be organized by Jos Vlietstra, just like the
previous two years. This is an event that we have grown to like a
lot, and if you like Atari, you will want to be there, maybe buy some
things, or just watch some of the MIDI demonstrations.
If you wish to participate contact Jos Vlietstra by E-mail. You can
mail him at this address: jo.vlie*at* hccnet.nl
Of course replace the *at* by the @-sign.
Everyone should bring their own sandwiches and drinks, since there is
no place to buy these close by.

Directions:
By train: go to the station Dordrecht Zuid.
Walk on the left side of the S. van Gijnweg towards the Sterrenburg
district. After 5 minutes, you can see the back of the school. Turn
left walking on the pink Steve Biko bicycle path and follow the green
fence until you reach a gate after about five minutes.
By car: from Rotterdam take the left tube of the Drechttunnel.
Then take exit Papendrecht immediately after the tunnel. At the
traffic lights go straight for a short while, then take a right turn
onto the Laan der Verenigde Naties. At the next traffic lights go
straight on, passing the Shell pump, then take a right turn at the
next traffic light. Follow the road straight on, passing the traffic
lights, take the railroad tunnel then make sure to be in the left
lane.
Take a left onto the kapteynweg and take a left again and park.
Take the pink bicycle path again and find the gate as above.
If coming from the south, follow direction Dordrecht, take the exit
Centrum, take a right onto the Laan der Verenigde Naties and follow
the directions above.

Attention: The front of the school will be closed! Do not be alarmed,
the entrance to this event is on the back.
See you all there!

Define no sound. If u are looking for sound from CD, u need to connect CD output to Falcons input. U don't need that for YM or samples tho. U can just try to check how matrix is set. I doubt Falcon is totally mute.

Sam, you've got a CT60, so make sure you have the floppy power connector
hooked to the CT60. This *has* to be done to get sound. I did the same
thing, using a power connector from a 3.5" IDE adaptor board instead, and
couldn't figure out why I did not have sound.

Probably 1.02, it seems to have good compatibility with older games.
Whatever needs 1.04, or better, should be OK with 2.06.

Mark

Check You have power supplied to the falcon motherboard. You need to
hook up the old floppy power cable from the falcon motherboard to the
CT60 conenctor. This is from memory, but I seem to remember
forgetting it once and having the same problem. 12v is used in the
op-amps buffering the DAC output I think!!

I'm looking for a dma chip with a number like this:
C398739-001A (Atari-1990)-31

As opposed to this: which my STE currently has.

If you have something like this, please mail me at ggn@atariROCKS.org
(remove all capital letters).

I think 1.02 for compatability too. Remember if you use a HD you have to
limit partition size to the old TOS versions limit not 2.06's. IIRC 16MB and
32 MB respectively.

Hi

If you've not left off the cable that others have mention then you'll find
the Audio amp's in 2 surface mounted 8 pin chips near the sockets.

Very old ST's ave a single sided floppy drive.

> The newer ST's, such the Atari 1040STfm can read Dos formatted floppy with
> the command:
>
> Format a: /u /t:80 /n:9
>

This formats double sided. I am pretty sure you can make a single sided
drive that can be read on a PC can be created on an old ST using something
like FASTCOPY. The ST FORMAT magazine used to come with double sided disks
where most of the stuff was on the first side and could be read on an old
ST. There was then a folder that could only be opened on a dual sided
machine. Not sure how this was created but it must be possible.
I wonder if an old FORMAT command from say NT3.51 would format 360K floppies
on a 2000 or XP PC. (/1 option).

>

An external drive will usually be double sided. You can also replace the
internal drive but this may require a little surery to the case.
If you want to keep your ST mint this may not be desirable.

> I don't know how much people are using a real ST. A ST is very cheap, but

I think many people are using a real ST, or at least Mega STE, TT or Falcon.
However most of these will read 1.44 floppies.

> I'm looking for a hardwaresolution, so i can use my older ST a long long
> time.
>

You could try a drive transplant as above, or an external drive. If you have
both a PC and an ST you can also use "Networking" to transfer software. You
could build an ETHERNET interface (hardware.atari.org). If you only want to
transfer small files you could use a serial cable and slip/ppp. In both

these case you would be using "Real" networking. I have an ETHERNEC (and a hard drive but thhats not needed) and use FTP to transfer files - http://www.dwade.freeserve.co.uk/atari/main.html has details

Alternativley you could use PARCP http://joy.sophics.cz/parcp/ wich uses a non-standard protocol, but which works well. In all these cases you would have to get some one withh an ST with a double sided drive to copy the software to a single sided disk to get you going. (I think all STs can format disks single sided, they can certainly all read them). I made the cable by chopping the end off a printer cable and soldering a new connector.

If you want compatibility with games, get TOS 1.00 - the original TOS.
A number of games from pre-1988 won't work with TOS 1.02 and above.
There are even some games that won't work with TOS 1.02 that work with
TOS 1.04! Go fig.

I wish this "TOS 1.02 is the best for games" lie would stop! It is NOT
TRUE!!! Maybe for emulators or some other oddball ST compatible, but
for REAL STs, it is NOT TRUE!!!

That is very odd, I have never had a game of this vintage not work under 1.02-ever. Calling it a lie is just plain dumb. We are talking about opinions here, not facts. Give me a list of games that don't work under 1.02 that predate the STE. Then Give me a list of games post-1988, in the interests of completeness, that don't work on either 2.06 or 1.00. I am bloody sure that you will find some in both categories.

I ran, and still run, a 1meg STFM TOS 1.02 just for playing games my STE does not like. I have yet to find one that I cannot play between both machines. I am sure there are some, but the hundreds I have run have been fine.

Mark

Mark, I've had the same experience here, basically. For me, and I'm not attempting to speak for everyone, but the biggest "breaks" came with TOS 1.04, and then another break with TOS 2.06. I have to say neither release was critical for me, in other words, most of my favorite games play right up through TOS 2.06 just fine.

The absolute biggest break for me was when I first got a Falcon. Lots of my ST games broke then. (just another reason to keep a functioning ST model around!). :-)

Not every TT has a 1.44Mb floppydrive. The firstmade TT were delivered with an 720kb floppydrive. I've found a TT030 with a 720kb floppydrive, but prepared for a 1.44Mb floppydrive. Every normal TT were delivered with a 720kb floppydrive. The 1.44Mb floppydrive was an option.

Sofar I know has a Atari pc (80286) the same drive as the ST.

410. Programmable oscillator for CT60

Newsgroup: comp.sys.atari.st
Date: 2005-02-08 17:49:36 UTC
From: "J.-Luc" <Myname.Mysurname@myisp>
Message-ID: <4208fbb0$0$2152$8fcfb975@news.wanadoo.fr>
Source record: 14836

Hello,

Last issue of Elektor proposes a programmable oscillator up to 100 MHz.
Didier Mï¿½quignon already commited the cpx to use it from TOS, which
could allow CT60 owners to make them run at the frequency they wish
(and the ability to restart at a safe frequency in case of mistake).
The thing is proposed ready-to-use for 52 euros here (incl. ship.) :
http://www.ak-modul-bus.de/shop/index.htm
However, this is very expensive regarding to the actual cost, if you
buy all components and build it yourself : 15 or 20 euros at most.
Finding someone who would buy all components and mount them would be
very cool - there must be around 250/300 CT60 over the world, most of
them running well at 66 MHz or more (mine perfectly runs at 72, and it
is a rev.1 68060, not a rev.6!).

Regards,

J.-Luc

I've always been able to mount components to a board fine, but I've proven that I am incompetent when it comes to manufacturing a PCB itself. Therefore assuming this is a kit with board and components together or something, I could easily do a run of 30-50. I don't want to ship though, I'd like to ship to someone else in bulk and have them do distribution. I don't have time or patience for that ;-)

Thanks,
Mark

> I'd like to ship to someone else in bulk and have them do distribution. I
> don't have time or patience for that ;-)

Sorry, my words must have been a little confuse : the board has to be
done too! The kit, ready-to-use, costs eur 52 shipped from Germany, as
it would only cost eur ~15 if done by oneself, buying the components and
making the board.
Cost for shipping within the EEC is eur ~8 (with insurance), and assumed
that the guy who'd make them should take eur 5 for the job, final cost
would be eur 28 - let's round it up to 30.
That is eur 22 less than the shop in Germany! I think it's worth it!
So, someone capable of doing it, and willing to have a glance at it ?

It's only a Mega ST. The drive has the gigantic eject button in the centre.

My TT and Mega STE have drive facias with offset eject buttons, is there
more than one variant of drive for the TT?

Do you mean the CLKGEN kit with programmable clock frequencies from 1 to
100 MHz, offered for 37 EUR list-price?

They offer the PCB with parts list for 7,90 EUR as well! I have no idea if
the price is OK though...

> Hi, Jean-Luc!

Hello Alexander,
>
> Do you mean the CLKGEN kit with programmable clock frequencies from 1 to
> 100 MHz, offered for 37 EUR list-price?

No : ~51/52 euros with shipping to France.
And, if I understood correctly, the frequency range depends on the main
oscillator : with a 10 MHz main osc, you can have 25 to 100 MHz.
>
> They offer the PCB with parts list for 7,90 EUR as well! I have no idea if
> the price is OK though...

Er... I think one of us did misread :-/
If I read correctly, 7,90 euros is for the CYxxxxxx only - but I might
be wrong : German isn't my best-spoken language...
NB : this chip is only $5 within the USA, which makes approximatively 4
euros - so they do sell them twice their price!
Moreover, my brother had a very negative experience with a kit he
bought from them : the parts didn't match the specs, and they charged
him an important amount (without asking him first) when he sent it back
to them!
I went to their site : they charge 1,35 euros for downloading this
single article (I think the review mustn't be more than 6 euros). I
think the only words those guys know are : ï¿½Moneyï¿½, ï¿½Moneyï¿½ and ï¿½Moneyï¿½
again.

Yes the Epson SMD-300 or 340 is a perfect exact fit. All you need is a Mega STE/TT front face so it matches the case, you can use the old one from the one in your computer now.

I have lots of these drives available for sale if you want one. These are 1.44MB drives.

Hi All,

Thanks to everyone for your responses but,,,,,,,it think the sound chip(s) are toasted. The floppy drive power connector is in fact plugged to the CT60 but no sound comes out the headphones jack to the external speakers.

Is it very difficult to purchase the correct chip(s) and replace them myself?

All advise, tips, etc. are welcome!!!

Thanks

I had no trouble getting hold of some, its a standard part as opposed to an
Atari special, fitting difficulty is dependent on personal skills. They are
8 pin surface mounted device, about 5mm by 7 mm.

Yes, many people still do use Atari computers. Ever notice how many cars
there are that are not made any more? Many, many years old? The concept is
very similar. Fond memories and more. Think of it as a labor of love.

Many of us get a kick out of tinkering (hardware and software)as well. :-)

That's because I got them :-)

Farnell or Rapid Electronics IIRC, I suppose Mouser in the States. One
LM386 per channel from memory, don't quote me.

> Atari special, fitting difficulty is dependent on personal skills. They are
> 8 pin surface mounted device, about 5mm by 7 mm.

Surface mount, ugh, still, if it doesn't work anyway...

I might be tempted to see if there's any sound available on the output
of the chip just in case the headphone socket's to blame.

426. Falcon video problem

Newsgroup: comp.sys.atari.st
Date: 2005-02-09 11:22:43 UTC
From: "Ronald J. Hall" <dark_lord@charter.net>
Message-ID: <pan.2005.02.09.11.22.42.383678@charter.net>
Source record: 14857

Well, I guess I've gone and done it now - I've tweaked until I broke something on my Falcon. :-(

I was trying to get extended video with Centscreen last night, and after I thought I had a 800x592x256 color mode layed out, I rebooted. Except it won't. My monitor immediately starts flashing all lights on the display (bad video signal received). Black sceen.

I tried booting into straight TOS, same problem. I turned the CT60 off, same problem. I turned the MB mod (jumper on the CT60) off, same problem. I disconnected the hard drive, and tried to boot up using HDdriver via the floppy only - same problem.

I tried using the keyboard combinations to bypass booting up with a HD, same problem.

I hooked up a different monitor to see if by some odd coincidence, that monitor decided to go belly-up. Same problem. Its not the monitor.

I took the cover off my Wizztronics case and tried to find anything shorted or burnt - nothing obvious.

I checked the cable from the monitor to the Falcon. Nothing there.

Anyone have any ideas, or suggestions? Thoughts on what in the world I did wrong?

Thanks.

TOS 2.06 will never work on a MEGA ST !!
It will on a MEGA STE !

MEGA ST, like ST/STF use ROM addresses at $FC0000 to $FEFFFF = 192 KB

MEGA STE + STE + TT030 + FALCON use ROM addresses at $E00000 to E7FFFF

To use TOS 2.06 on MEGA ST, you need to decode the addresses and chip select
the 2 EPROMS of your TOS 2.06 !

The 'mode 2.6' was the name of a such chip I did in 1993 !

Old time...

> http://www.atari-source.org

Hi Mark. Thanks for replying.

Well, I did have to put it back together <grin> in my Wizztronics case, but I don't think I moved anything more than would ordinarily be moved for this. It was working just fine, I had the whole kit 'n kaboodle completely sealed back up.

It was right after I used Centscreen that this happened. Some further info, I hooked it up to my (much) newer 19" monitor on my Mandrake Linux box, and the monitor said:

Frequency out of range:
Try other resolutions(s)

However, in case, as Rodolphe and others suggested, NVRAM was corrupt, or I inadvertantly set it to some bizaare and incompatible video mode, I did try booting up from floppy, using a program that is supposed to reset NVRAM in the AUTO folder on the floppy.

Except that I've got zero response from the floppy as well. I mean, no lights come on to it at all. I tried running a different power lead to it, still no power. I then took a spare FD from my other Falcon and hooked it up. It does the same thing. So at this point in time, I can NOT boot from a floppy to reset NVRAM.

It does sound like the hard drive boots up, and the CDRW does get power and spin up.

I tried the other suggestion that Derryck and Rodolphe made, using keyboard combinations, but I'm flying blind here. I tried it when the Falcon first booted up, I a few seconds after boot up, etc, etc, etc,. I've not had any success with this yet.

Any suggestions on what I can do here to sort this out?

Thanks everyone.

Okay, a further follow up. :-(

I removed the CT60 and reseated it. System booted right back up, no problems, as if nothing had ever happened.

20 minutes later, the video froze and the monitor lights all start flashing again.

I rebooted, back to the same problem.

Looks like its not NVRAM, but that connection. :-(

Anything I can do here? I'm not very good with a soldering gun, by any stretch of the imagination, but I'm not afraid to try with some good instructions. :-)

Thanks.

Do you hear key clicks or bells? Your sound worked well enough when your
falcon left my care... Make sure you're plugged into the right jack (the
one closest to the DSP port, and make sure the volume is up. Playing a CD
in analog mode will never put sound output to the falcon's audio port.
That's just not how it works. I have high doubts that anything is
completely fried despite the fact that your sound was having issues for me.

Thanks,
Mark

Beyond the fondness some of us have 'retro' equipment from our
childhoods, if you get to some of the higher end Ataris, they are still
useable today..

Sure not exactally going to beat some new fangled 'PC', but they are
more then enough to do daily work on.. a 68030 with a decent OS on it is
nothing to sneeze at..

Maybe a crash of the NVRAM parameters !
Your falcon is now booting in SM124 MONO ST mode ...eh eh
You have to reset the NVRAM !

You can't because you see nothing ???

eh, you should have used one time in your life CBOOT (software from centek
like Centscreen) and create a boot disk that is able to reset NVRAM when
booting the Falcon.

Other solution : find a ST MONO monitor !

Regards

PS : as I remember there is a keyboard solution to reset NVRAM : Control +
UNDO or Control + left Shift + UNDO when powering ON the falcon...

Most likely you need to reset the NVRAM. Erm, is it CTRL-Help or some
other key modifier, should be in the CT60 docs somewhere I would think.

Assuming that you didn't move stuff around too much. Sounds awfully
coincidental to be the J20 repairs that I've done gone flaky. But that
was the symptom too. The falcon starts with a bad video mode of some
sort. (but doesn't actually do anything). Do you hear it booting up?
Hard drive or fdd access still?

Thanks,
Mark

That's OK. It's still a good question.

For me, the answer is no. Aside from playing a few games, I do not use either my ST or my STe. I could still do so as I have a Link adapter and hard drive in my closet, but ST medium and ST high just are too limited for my current interests.

On the other hand, I use my Falcon for everything at home except Internet browsing and creating DVDs. I find the interface pleasant and can still use quite a bit of software that I would have to repurchase if I changed systems. In addition, I can still access any file I've created since I purchased my first computer in 1989.

For the future I've purchased a "backup" Falcon and am playing with the CT60 I installed in it. Hopefully that will become my primary system someday soon. I also have a copy of MagicMac installed on my Powerbook. Although the day will come when neither of my Falcons work, I expect to be still booting something into Atari compatible mode for decades to come.

Galen (who ironically is using WinXP at the moment)

You have 1 missing pin in J20. That header has been the bane of my existence on your falcon. For some reason the solder doesn't want to flow well in there with the new header. I've never had anything like this happen to me before. I sent you an email about using the soldering iron. If you're uncomfortable with that you can of course send it back to me and I'll get it working again (and flex test the board a bit too this time ;-)) before sending it back. Should be a simple matter of holding an iron to each pin of J20 for 5 seconds, depending on iron strength.

To be honest I think the problem is simple. With my micropoint tip I only do smt work. Heating a leg of smt is instant so I use "6" on my soldering iron. When I do larger work for myself (like that header) I tend to use my standard tip. I think what happens is since the standard tip has a lot more metal it holds a lot more heat, and thus transfers more heat into the leg. So when I do work on bigger stuff like that I'm used to holding for a smaller amount of time. But your falcon is weird. Even with the micropoint tip I had to hold some of those legs for 10+ seconds to let the solder flow down through to the top of the board. I wonder if the micropoint tip just doesn't produce enough heat for large work, so the solder cools before it ever gets down the leg. Possible.

Sorry about this Ronald...
Thanks,
Mark

Strangely enough, I find my falcon + highwire is a very pleasant machine
to use for web browsing. The forced 640x480 is easy on my eyes after a
long day of 1280x1024 on the PC. Some day the falcon will have such a
high rez too and I'll just have to bump up the font sizes as I age ;-)

Thanks,
Mark

You bet !

I bought my first ST in the late 80's/early 90's for MIDI-Recording.
It has NeVeR left, only was upgraded to STfm, with external HDD.

Together with CuBase and Notator, it has been, and still is the one
item no 'serious' electronic musician can do without.
Sure, a PC can control MIDI devices too, but even nowadays, the
timing of the STfm appears to be more accurate than the timing of
a PC.

If it would die on me tomorrow, i'd search all over the country for
a replacement.

Grtz,
RoB

My first Atari was a 65XE with a tapedeck. Some years later I bought a 520STfm. It was an great working computer, but with 512kb ram. I've bought some parts, and has build the computer out to 1Mb ram. The folowing update was a Dos emulator, that could be placed over the cpu.

At last I bought a Mega STE. The best Atari I've ever had. Because the ICT-study I've made a big mistake to sell the Mega STE, and build my own pc.

Last summer I've become some ST's for free, and so I'm an ST owner again. I have bought some software and books, also with Atari hardware. Now I want to buy a real TT. The next thing I want to do is looking for a Mega STE, and then I can run my favorite software again.

A real Atari works better than an ST emulator on an Windows machine. It looks nice, but there are so much things that wouldn't work.

Yes, I'm an Atari user again, and I'll hope that I'm not the only Atari user in the Netherlands.

Hi, Jean-Luc!

J> Er... I think one of us did misread :-/

Seems so.

J> If I read correctly, 7,90 euros is for the CYxxxxxx only - but I might
J> be wrong : German isn't my best-spoken language...

That's what I've read on their site as well.

J> NB : this chip is only $5 within the USA, which makes approximatively 4
J> euros - so they do sell them twice their price!

And that is even the price for batches of 10+ chips.

J> I think the only words those guys know are : «Money», «Money» and
J> «Money» again.

That's a pity.

But anyway - the chip itself does not need much external circuitry (from what I can see from the pictures), so creating a small pcb that even would fit in the oscillator socket probably won't be a big job.

Mark's followup seems likely to be the root cause, but if anyone else has really corrupted NVRAM I have witnessed a Falcon being booted WITHOUT the NVRAM chip being inserted, and then plugged in and the correct settings applied whilst the Falcon was still powered up.

Extreme measures, and it does depend on a socket being fitted - which brings its own problems if you're keeping the standard case.

First, I would recommend using small schottky diodes instead of the 1N4148.
Second, AFAIR, the ROM2 signal is not open collector, so pulling that low
via a diode may overload the output driver in the MMU, or lead to unstable
operation due to unstable signal levels - I would really suggest ORing[1]
the F138 output with the original ROM2 signal and feeding the output of that
OR to the Eproms - like in the original text you linked to.

cu
Michael
[1] which means using an AND gate since this is negative logic

Try to replace falcon ram. Try another ram board.
Video need some space on falcon original ram.

Try to glue a heatsink on videl chip.
Your problem sounds a litte bit like a heat problem.

> Looks like its not NVRAM, but that connection. :-(

Some spare falcons had bad soldering on mainboard below
Try to resolder all the pin of the expansions port.

(Use a smal solder iron an very thin solder!!)

Try to delete NVRAM with nvrst.prg. That smal .prg delete the content
complete clean, use bootkonf.prg to set standard parameter into NVRAM.
After than you can try it again with other tools.

Hi Michael,

> First, I would recommend using small schottky diodes instead of the
> 1N4148.
For what reason?
The 1N4148 is darn fast anyhow, would the reduced voltage drop of a schottky
make any difference?

> Second, AFAIR, the ROM2 signal is not open collector, so pulling that low
> via a diode may overload the output driver in the MMU, or lead to unstable

ROM2_ isn't open collector :(
There's .06A between it and ground @ 5V.
I have tried grounding the ROM2_ line, to see if it did cause damage to the
MMU. After 20 odd minutes of it being grounded the MMU didn't seem to
dissipate any extra heat and doesn't seem to suffer from it.
(Any mega with U12 fitted has it's MMU ROM2_ buffered by it also)

I agree that adding the AND gate makes it a better circuit but i don't seem
to be able to find a single AND gate in IC form. Using the 74x08 is a waste
for one gate, DTL is an option I suppose.

TI used to offer some single gate ICs but i don't recall the part# :(
.
Thanks for the comments.

Egon

I beg to differ. My second ST was a Mega ST4 with a TOS 2.06 upgrade installed on some kind of adapter board. The machine was given to me that way by a retiring Atarian who used it mostly for DTP work. I don't remember the details, but it worked just fine for years until one day it just died on me. It was replaced with a Mega STE, also with TOS 2.06, and it was all I could do to tell the difference in performance.

I know I've seen a list of games that will ONLY work on TOS 1.00. Off the top of my head:
Games don't work on TOS 1.02+:
The Golden Path
The Pawn
Knight of Orc
Into the Eagle's Nest
Gunship
Bad Cat
Dick Tracy
Hammerfist
Star Quake

Games that don't work on TOS 1.02, but work fine with TOS 1.00 and TOS 1.04:
Street Fighter II
Defender II
They refused to work on my TOS 1.02 MegaST, yet when I upgraded to TOS 1.04, they worked fine. Both came out in 1989 when TOS 1.04 and the STE were released. It's really weird!

Games that don't work on TOS 1.06/1.62 and TOS 2+:
Too many to list. I could search my magazines as I know when the STE came out, people who upgraded were complaining about "Why my game doesn't work on my new STE, but it works fine on my old ST?"

I have some of these games, so I know first hand that it's true. BTW, I never said there were any games post-1988 that don't work on TOS 1.00.

If the games that you have work fine in your TOS, that's great! But the blanket statement that TOS 1.02 is the best TOS for compatibility with ALL games (not just the games you own), is wrong (as shown in the lists above). TOS 1.00 is still the best TOS for game compatibility as shown above.

It is very possible that TOS 1.0 can run more games than 1.2. However TOS 1.0 has quite some serious bugs that most possible would prefer to miss a handful of games and get a more stable TOS.

Of course, if you don't have a hard disk, don't use it for anything at all than games, then the bugs might be not so important. But note that TOS 1.0 has a very nasty bug when reading floppies. Sometimes it will not detect a disk error and will read corrupted data.

More important than TOS 1.0/1.2 is to have an European TOS. Many games don't run with US TOS. Some will if using the 50 Hz booter, but not all. And even then it is cumbersome because with most US ST monitors you need to manually adjust Vsync to switch from 60 to 50Hz. There are some games that are the opposite, run on US TOS only. But they are very few and most (if not all) of them have an euro release.

Star Quake was one of the first games I got for my TOS 1.02 equipped 520ST,
and I played it many hours without problems. Don't know about those other
games you listed though, I never played them.

It has very little (or nothing) to do with TOS, it's a hardware issue.
There's a lot of differences between the ST and the STE.

Speaking of U12, there are two unused AND gates on it which would
be sufficient for this purpose.

Or maybe one might use a chip with open-colector AND gates instead
of any diodes, and feed from those both the DTACK and the CE signal
to the EPROMs (fitting to the latter one a suitable pull-up).

Indeed there are.
One of the inputs used on the current used gate set-up is tied to +v so that
could be used.
I think the unused inputs are grounded to tracks that run under the IC
though :(makes it a tad difficult to cut the track, and lifting pins is a
PITA compared to adding a 74x08.

> Or maybe one might use a chip with open-colector AND gates instead
> of any diodes, and feed from those both the DTACK and the CE signal
> to the EPROMs (fitting to the latter one a suitable pull-up).

DTACK_ isn't an issue, the diode will work fine for that, it's just the CE_
that might cause a problem.
I've been discussing it with Michael.
I came up with another solution that changed the CE_ line, but that
introduced a hysteresis that would probably be too high.

The only reason i put the diode CE_ output in the circuit was to keep the
parts and soldered pin count down so that the average Joe could knock this
together with minimal effort.

I may have to go with the 74x08.
Adds another few pence and a few minutes to the build, but still do-able by
anyone with an iron and some patience.

Hey-ho.

Egon

Hmm, Thats odd.

I've had a Mega ST4 with the standard 8mhz speed and a Mega ST4 with an
Adspeed accelerator, running at 16mhz. There is quite a difference between
the 2... :-)

>I'd suggest replacing the drive. Sounds like it's gone south.

Don't think so. Depending on the TOS version, is perfectly normal when
booting without a disk. TOS 1.0 does step the head a few times before
giving up. Not sure abot TOS 1.2, laters ones are more aware of
"floppyless" boots.

However the "clicking" should stop when booting is completed (either with
or without hard disk). With older TOS versions the led might stay on until
inserting a disk and it takes a very long time to finally boot.
If the clicking continues after the desktop shows up (not just the led
stays on), then something is wrong.

>The 1N4148 is darn fast anyhow, would the reduced voltage drop of a schottky
>make any difference?

Yes.

A 1N4148 has about 0.7V Vf at low currents. A Motorola 74LS00 has about 0.4V
Vol, which makes a low level of about 1.1V.

The typical input threshold of a 74LS is given as 1.0V at 25°C in the
Motorola databook - which means you can not reliably drive a TTL input low
with a 1N4148 in series. Now depending on input threshold (CMOS has a higher
threshold, so you have more margin), and variations on output
characteristics, this may or may not work, but a BAT43 or similar will give
you reliable operation in any case, so why gamble?

>There's .06A between it and ground @ 5V.

>dissipate any extra heat and doesn't seem to suffer from it.

With 60mA Ioh, the MMU will at least pull the "L" level even higher,
reducing margins for reliable operation.

>I agree that adding the AND gate makes it a better circuit but i don't seem
>to be able to find a single AND gate in IC form. Using the 74x08 is a waste
>for one gate, DTL is an option I suppose.

>TI used to offer some single gate ICs but i don't recall the part# :(

They still have them - I recently used them in a design where I really only
needed one gate.

A quick search at ti.com finds AHC1G08-5, SN74AHCT1G08, LVC1G08-5.0, but all
single gate ICs I know are SMD only, and in low quantities, they are
probably more difficult to get than a standard 74F08.

Diode logic has a slow RC turn off, so a low-value pullup resistor will be
required.

475. CT60 TOS updated 1.03

Newsgroup: comp.sys.atari.st
Date: 2005-02-13 15:15:49 UTC
From: NOSPAMS@wanadoo.fr
Message-ID: <1grxjcn.1p1p2q51hgtir6N%NOSPAMS@wanadoo.fr>
Source record: 14752

Hi,

I have updated again the CT60 archive (boot & CPX 1.03).
There are a new patch for boot on the old Caviar drives without floppy disk.

But the main feature is the Programmable Clock Generator, the ideal solution for get the best frequency of your CT60 !

I have used a module from http://www.ak-modul-bus.de/shop/index.htm.
This module use a Cyberclock CY27EE16 from Cypress.

The CT60 TOS and the CPX test if the module exist. It's possible to change the CT60 clock between 50 and 100 MHz by step of 125 KHz.
The Programmable Clock Generator is installed on the CT60 oscillator socket.
Sure there are limits fixed today at 80 MHz for the 060 rev 1 and 110 for the 060 rev 6.
You can change the values on the fly for do some speed tests, or change the boot frequency.

The documentation is on-line, main link inside http://ct60conf.atari.org or else http://perso.wanadoo.fr/didierm/ct60/pclock-e.htm
I have just replaced the module schematic by a CY27EE16 synoptic, but you can found the schematic on the HYP documentation from the CT60 archive.

Now the best...

Rodolphe can create a little module for the CT60, needed for install an Ethernat and a Supervidel card, for a better price (30 EUR) if there are lot of peoples interrested (40 or more I think).
With the possibility to put an oscillator for program the clock generator with the CT60 during the first time (my solution with the ak-modul-bus use the 030 mode and a Modem 2 link).

Please contact rodolphe if you're interrested by a new module !!!

Regards,

Didier.

H Brian,

> All my ST class machines keep an active floppy drive when booting from
> the hard drive...

I remember this problem from my old Ataris. Old TOS versions dont switch the floppy drive off, if they boot from harddisk. I dont know which TOS solves that problem. I think, ist was not present in my TOS 1.04.

> an endless click till a floppy is shoved in its clicking jaws.

As far as i remember, it was not a click. The engine of the drive tries to rotate forever.

> Is there per chance an auto folder utility that'll put drive A: to
> sleep till it's needed? Know where I might find it if does happen to
> exist?

Many years ago i wrote i auto folder utility for my personal use to solve this problem. If you like to give my program a chance, i can put it on my download page.

Yes, you're right, why gamble.
I've updated the schematic to have schottky diodes.

> Diode logic has a slow RC turn off, so a low-value pullup resistor will be
> required.

The 74F08 is in the new board here with TOS switching.
The webpage will be updated shortly with it.

Thanks for your comments and help.

> the 2... :-)
>
I have a Mega ST4 with Adspeed and the TEC TOS2.06 card. According to the
benchmarks the Adspeed works properly but I only ever noticed a real world
difference in one program from just the hardware acceleration. Migraphs
Touchup had a feature, can't recall what, that didn't work very well at 8mhz
but did at 16. 90% of the improvement in other areas came from the software
accelerator (Quick ST II)that came with it. I'm using Warp9 now.

If you or others had a different experience it might be worth starting a new
thread.

Obviously 2.06 can and does work on my Mega ST.

Yes you are right, I didn't mean it was a "problem" but more of an anoyance.
There were patches that lessened the clicking or turned it off without
affecting the drive polling.

How about games that work on Tos 1.02 and not 1.00, there would have to
be some? What was 1.02 1986-89? Tos 1.00 was only 1985.

Yup, just plug one in. It uses a PLCC type chip, the socket is under the
power supply. FWIR, it is only a 16Mhz FPU on a stock Falcon, so your
33Mhz chip should be fine. Both my Falcons have one. It is just nice to
fill the socket;).

I'd like to add something to the message from Didier :

The CTCM (CT60 Clock Modul) is not needed for EtherNAT or SuperVidel card...
It is compatible with !

I mean that this modul will not give problems about the height under the
Supervidel or EtherNAT cards !

I hope this is clear for everybody : you don't need the CTCM to buy and use
an EtherNAT or SV or both cards !

CTCM just allows you to set the frequency of the CT60 (CPU + SDRAM + 32-bit
060 BUS (includes the Expand port)).
And it can be plugged between the CT60 OSC socket and the add-on card you
plug.

PS : the CTCM will need (NEED !) 2 wires to be soldered under the CT60...
A picture was send to all CT60 + CT63 registered guys. It is easy to do.
I will not do this work, even if you want to send back the CT60. For CT63, I
can solder them before I ship the CT63.
Let me know... Consider you will have to add 10 EUR for this job.

This time 18 people have reserved the CTCM.

Regards

Hi,

I just downloaded pgp50ib.zip, a PGP 5.0 port for Atari by Harald Denke=
r =
from 1998. In the man pages it says there are separate binaries for dif=
ferent =
tasks, e.g. pgpv for decryption and verification, and pgpe for encrypti=
on.
In the man pages it also says these are links to the common engine pgp.

The thing is that these binaries were not included in the archive. I've=
=
downloaded the archive from three separate locations, but they weren't =
there =
in anyone of them.
I've also tried creating symbolic links to pgp50i.ttp, naming them pgpv=
=
etc, but it seemed it didn't make any difference. It was just as if I h=
ad =
executed pgp50i.ttp.

I know there's an older version (2.6.3), but it didn't support the DSS =
key I =
already have.

Anyone has any experience of this port or ideas of what I could do?

Regards,
Mikael

Yes they do! and in our recording studios we always have an Atari with Cubase and Notator available for many of the Artists who made and still have data for their hits on floppy disks.
On occasion we are asked to source the very rare and unique portable STacy for such guys, when we can turn one up £500 is not an unusual sale and I have seen them fight over a well specked or upgraded machine with offers going into four figures

In addition, there are

- the Crazy Dots cards by TKR, based on the famous Tseng Labs ET4000,
either with 256 or 32767 colours (the latter known as "Crazy Dots HC")

- the Spektrum cards, also based on the ET4000, the most common being
the Spktrum 1TC (1 meg, 16.7M colours)

- several professional, but scarce cards by Matrix ("Matgraph")

The mach32/64, Matgraph and ET4000 cards are directly supported by
NVDI5.

One should also have a look at <http://www.atari-home.de>, sometimes
Nova or Crazy Dots cards are offered there, e.g. on October 22nd:
<http://atari-home.de/forum/index.php?board=2;action=display;threadid=1543>.

Hi all!
For anyone who lives in the Toronto area, I have a 520ST with the SF314 drive and over 100 disks, mainly copies. I do not have the mouse or video cable, but it does come with some sort of dongle for the joystick port. I am not sure which program it is for. The unit does work, and it has a GEM copyright 1985.

I am looking for a direct trade for an Atari 8-bit computer with a disk drive and/or other accessoires. Preferrably an 800xl, well, anything except the 400!

If you are interested, email me at the above email address.

Thanks!
Michael

504. MyMail 1.74 / MagiC! 6.2

Newsgroup: comp.sys.atari.st
Date: 2005-02-16 18:36:26 UTC
From: "J.-Luc" <Myname.Mysurname@myisp>
Message-ID: <421392aa$0$19410$8fcfb975@news.wanadoo.fr>
Source record: 14778

Hello,

Has someone else than me problems using MyMail 1.74 under MagiC! 6.2,
or am I alone ?
I have program and data in different folders.
Often, MyMail crashes when launching (or, to be right, I'd say it's
MagiC! that crashes : error 69 or something approaching). Then, after 2
to 10 retries, it launches and I can use it until I close it, and then,
if I launch it again... :-(
Sometimes, it erases the nohome file, and then creates the whole
data structure into the program folder, so I can't use it.
I thought I could fix this by setting nohome as read-only, but despite
the file isn't erased anymore, it still modifies the location of the
data.

Anyone else ?

MB> vortex datajet disk

This is for the SCSI hostadapter from Vortex. The HDplus use a MFM/RLL drive with a XT bus interface. So I think the driver will not work, but he can use CBHD.

Source record: 14779

Yes Michael, I'd much like to try this utility.
Thanks!

My Mega 4 has a Wizztronics TOS 2.06 compatibility plus board, and an XTRA RAM 8 board. The drive light does stay on if booted with an empty floppy drive.

My STacy 4 has TOS 1.4 on a 2 chip set. It behaves the same way.

It seems to me the drive does continue to spin..tho' I might be wrong...I haven't gotten 'that close' to the thing to be sure.

STacy: The less drain on the aging powersupply the better. It also has a hard drive in it that's pretty power hungry and runs pretty hot...keeping a floppy in the drive for very long is sure to see it get cooked before its time.

Mega: Again, the power suppy is aging. The XTRA RAM also demands quite a few more milliamps than intended from the stock power supply....so the less useless drian of power, I feel the better.

Thanks,
Brian

507. TOS 2.06 in a STacy?

Newsgroup: comp.sys.atari.st

Anyone know right off the bat if TOS 2.06 works in a STacy?
Mine currently has TOS 1.4 on a two chip set as part of the STacy 4
memory board (holds 4 1mb SIMMS and a two chip TOS set).

Main reason I'm considering the upgrade is the built in time delays for
drives and whatnot to spin up...of course the other benifits would be
nice as well.

Thanks,
Brian

That requirement can be met with NoRoach as well as other 3rd party utils.

hi

your problem is XP. ft.com trys to access the hardware directly this is not possible under nt,w2k or xp.
you could try to use a real dos with this it should work (a dos boot disk should
be enough). or install win98 as dualboot so that you could boot win98 make the file
transfer and then reboot into xp.
i hope this helps

with nice greetings

Yes, the motor keeps spinning. That's perfectly normal. Actually, that's the reason that the led stays on. TOS waits until motor is off before deselecting the drive (deselecting the drive will turn off the led).

Motor off is handled automatically by the FDC. The FDC turns the motor off signal after being idle for 9 revolutions. But without a disk, the drive will not produce index pulse signals, the FDC will never detect any revolutions, and will keep motor on all the time. If motor stays on, then TOS doesn't deselect the drive and the led stays on.

Whatever utility you get to turn off the led, it should do that only indirectly. If it just deselects the drive then the motor will still keep spinning. So the fix is to reset the FDC and NOT to deselect the drive. Once the FDC turns off the motor TOS will deselect the drive and turn off the led.

Hi Jean-Luc!

JL>Has someone else than me problems using MyMail 1.74 under MagiC! 6.2,
JL>or am I alone ?

JL>Often, MyMail crashes when launching (or, to be right, I'd say it's
JL>MagiC! that crashes : error 69 or something approaching).

I don't have this problem with MyMail, but a similar one with StarCall.

I get a runtime "Error 202 at offset $FF077A80" or "wrong AES call 1" (program returned error -248) or some 68000 exception.

This is on the Milan only, not on the CT2A Falcon. I don't have a real solution, though :-(

My workaround (found by trial and error) is to start some other programs. In my case, start QED, start spider2, terminate spider2, start spider2 and start StarCall. In most cases it works afterwards...

With best regards
Ekkehard

Still not good. First I thought it was Okami itself which couldn't
handle certain messages correctly but Pan (Linux) and Xnews (XP) display
the same bad look.

Probably somewhere a bad setting.

ps. I've tried to use Cat (latest version) but sofar no luck. For some
reason I can't retrieve the full list of newsgroups of my ISP.
Retrievement stops after a few seconds. I tried a German Newsgroup
server (news.individual.de) but I only got a few newsgroups (new ones?).
Do you know how I can force Cat to retrieve a full list of newsgroups?

I made the mistake of not filling in the NNTP-account information before running CAT and initiating the "Tausch" the first time. I could not find the way to force the retrieval of the full list, so I reinstalled CAT and made sure all the account information was there. Apparently, according to the HYP, a lot of initiations are done the first time.

Well, as I had done this, the full list was automatically retrieved upon the first "Send/Recieve".

I did find something yesterday though that might do the trick w/o reinstalling the program. Haven't tried it myself yet though.
In the German version, go to Tausch -> Infodateien.
If you're lucky, there'll be a textrow "YGA [...] Gruppenliste komplett". Now mark this entry in the list, click "Ändern" and in the dialog mark "Sofort anfordern". At the next Tausch it should retrieve the list.

Cheers,
Mikael

Ok this did the trick. Thanks. Only it seems Cat doesn't retrieve the whole list. But anyway the most important groups for now are listed.

Boy I thought Okami was hard to set up, but it was a piece of cake considered the PITA I had and still have to get Cat running. :-)
Without the English setup text on Dimitri's page I never would have been able to get Cat running.

Hi Martin!

MB>ps. I've tried to use Cat (latest version) but sofar no luck. For
MB>some reason I can't retrieve the full list of newsgroups of my ISP.

But at least Cat is running now. Very good!

MB>For some reason I can't retrieve the full list of newsgroups of my
MB>ISP. Retrievement stops after a few seconds.

Is the cache for STiNG or GlueSTiK set large enough? The default setting is too small! For GlueSTiK, add the line ALLOCMEM = 150000 in your default.cfg if not yet there and try again.

MB>Do you know how I can force Cat to retrieve a full list of newsgroups?

There are two settings.

1) swap/configure infile: [x] request info-files
this one globally (de-)activates retrieval of info files like the groups list. But it seems to be active anyway, as otherwise you wouldn't even get the short list.

2) swap/info files...: double-click list entry YGA and tick "order immediately"

This one commands In2Cat to retrieve the full list. You can also set it to retrieve the list regularly, but I don't recommend this as the list is huge and the differences (new groups) are retrieved anyway. I fetch it just once a year or so to also remove no longer existant groups from the local list.

With best regards
Ekkehard

Hi Brian,

> Yes Michael, I'd much like to try this utility.

I have put it on my homepage:

http://www.mbernstein.de

It is a german homepage, but you should find it without german knowledge:

Go to the download page (link is in row with disk symbol)
Then go to Atari ST
Then download flpdesel.lzh

Put it into the auto folder. The soure code is also included. It depends on
a very good german book about drives on Atari ST computers: Scheibenkleister

Regads
Michael

> indirectly. If it just deselects the drive then the motor will still keep
> spinning. So the fix is to reset the FDC and NOT to deselect the drive.
> Once the FDC turns off the motor TOS will deselect the drive and turn off
> the led.

No. My tool deselects the drive and as a result the motor stops. And i had
never problems with my tool.

Regards
Michael

Sorry I meant that I assumed that you only need NVDI 5.0x to use a Nova video card, and that the NOVA VDI (2.63?) is not necessary. I have been told that it should work out the box, and I have tried setting up NVDI 5.03 several times without the Nova VDI software present, and I dont get anywhere, so I have both enabled.

Coda.

FDrom reading the NVDI wep page, I also assumed that. It works this way with ET4000 cards like the Crazy Dots and Spektrum (I should know, I once owned a TT030 4/16 with Crazy Dots HC and NVDI3/ET4000 (back then, this version was sold separately from the "standard" NVDI).

Source record: 14707

Hello, I found a stock of MC68060 REV 6 MASK E41J !
There can run up to 100 MHz on CT60 & 63.

The price is from 85 to 120 US$, not fixed because I have not confirmed the quantity...and the date to buy them !

Let me know as soon as possible if you really want to buy a such CPU....

For CT60 users, I will take back at a low price (around 30$) the old 060 you have.

For OSC, the 100 MHz OSC is possible or the CTCM (recommended for such high frequencies your will to tune).

MOVE !

536. Davidow's "BeachWalk" song for Music Studio

Newsgroup: comp.sys.atari.st
Date: 2005-02-19 00:49:30 UTC
From: Mark Lehmann <spam@marklehmann.com>
Message-ID: <1108774170.713048.119820@z14g2000cwz.googlegroups.com>
Source record: 14710

A buddy and I spent last weekend reconstructing a song we first heard on an Atari ST using Music Studio. The author of this song is simply stated "Davidow." I'd like to know who this person is and get his or her blessing to release the reconstruction of the song to the public.

The process used was to take old ST disks and use several of the disk utilities on the STEEM emulator website to convert the floppy disk into a disk image for the STEEM emulator.

We then used the STEEM emulator under Windows XP to run a program called "XMARK64K.PRG," since Music Studio just doesn't seem to load. Using XMARG64K, we converted BEACHWLK.SNG to BEACHWLK.MID. Last we imported BEACWLK.MID into Apple's GarageBand.

Does anyone still remember Music Studio by Electronic Arts? Does anyone know who "Davidow" is or what happened to him or her? Would anyone like to hear the old "BeachWalk" song?

awesome !!! another fellow musician!!

The author of this song is simply stated "Davidow." (?????????)

I'd like to know who this person is and get his or
> her blessing to release the reconstruction of the song to the public.

he too is a midi musician....i have no sense-ability to locate him...will
try as well..

>> Does anyone still remember Music Studio by Electronic Arts? Does
> anyone know who "Davidow" is or what happened to him or her? Would
> anyone like to hear the old "BeachWalk" song?

yes ,this is what my ideal of a functioning newsgroup is, rather than a
smear of off topic commercials...so will you email
the song to me ...

i own either music program electronic arts music studio and the song
converter as well.

ok keep in touch.

Hello Mike,

MF> I thought I read that the *68060's* were internally
> double-clocked, so that while the marked MHz rating
> and external clock speed is 50MHz, the chip inside is
> actually running at 100?

If I remember correctly (and it's been a few years) all 68040s are clock-doubled, but are not marketed with the core speed (so a 2x 25MHz 68040 is sold as a 25MHz chip). By the time the 68060 came out, Intel had begun marketing their chips with the core speed (or something like it: an i486 DX2 66 was 2x 33MHz, an i486 DX4 100 was 3x 33MHz). Motorola seem to have followed suit, so a 50 MHz 68060 might have a 25 MHz external bus (I should probably download some manuals to check that).

MF> I may have misread what they were saying, but I know
> that this was refering to the 68060. They called it
> "superscalar". The 68060 was the first to have that,
> according to Motorola's site, if I read it correctly.

I'm fairly sure that "superscalar" has nothing to do with clock speed or multipliers: referring instead to the presence of multiple execution units within one processor. This is sort of a "brute force" approach to speeding up microprocessors by throwing transistors at the problem. Pentium, 68060 and perhaps StrongARM are three examples of this approach.

- Andy Ball

No it's not true, the external hardware can choice the bus clock fosc,
fosc/2 or fosc/4 for example on the CT60 the 060 rev 6 is clocked at 100
MHz, the bus clock and the SDRAM are also at 100 MHz.

Regards,

Didier.

Thanks for the correction! That sounds like a flexible approach (and is preferable to the 'Motorola as marketing victim' hypothesis. ;-) Was I right about the 68040 being fosc/2, or is it similarly configurable?

I don't know the 68040, but with the 060 there are an MCLK/ pin asserted
by the external hardware.
- Pin MCLK/ to the GND => full bus speed => CT60
- Pin MCLK/ asserted 1/2 clock => half bus speed => Hades 060
- Pin MCLK/ asserted 1/4 clock => quarter bus speed => "Milan 060"
The 060 himself is not affected, only the bus.

Regards,

Didier.

Hi folks,

I've currently got an old style Mega ST case, the one with the centrally
located floppy eject button.
I'm looking for a later style case, the one with the floppy eject button on
the right.

Anyone have a case hanging about?
And perhaps a keyboard too?

TIA

Egon

Won't work on my G3 433, OS 10.3.8
I double-click the application, and it tries to load and quits. Any
chance of fixing it for G3's?

I know, the README is in French. But it's simple installation.
For a safe first start, you should unpack the MacAranym.zip
archive in the "Documents" folder of your home directory. Then
it should work right away. Then you can move the application
in the "Application" directory ... I'm interested to know if
it works on your G3 !

Have fun, and good luck :)

Hi all,

A friend of mine has got a monitor connected to his STFM and it works fine.... Though connecting it to his STE he gets no picture at all.... Apparently the STE works fine on RF, so apart from the port being faulty is there anything else which it could be ?

Cheers,
Chris

557. [PUB]Zview Beta 5

Newsgroup: comp.sys.atari.st
Date: 2005-02-20 21:38:39 UTC
From: Zorro <Zorro271-1@yahoo.fr>
Message-ID: <421902e7$0$18466$626a14ce@news.free.fr>
Source record: 14733

Hi,

Well, after 2 months, it's the time for a new beta version..

So what's news?:

- 68000, 68020 without FPU and 68020-60 version of the codecs and
binaries available.
- Full screen mode with automatic picture resize if this one is bigger
that the screen. (F10 shortcut)
- Another cool feature: when a window is iconified, zview show a
thumbnail of the picture inside.
- With the last Aranym from CVS, the JPG pictures are decoded natively
with the host CPU !! (to use this feature, "nfjpeg.prg" in your 'auto'
folder before MiNT). Many thanks to Patrice Mandin for his work on Aranym !
- The DSP and the main JPG codecs are now merged in only one codec. If
the brainstorm's cookie is detected and you haven't a 68060, the JPG is
decoded with the DSP, else the CPU routine is used.
- Support of DEGAS compressed added (PC1,PC2,PC3).
- Others littles changes like recompilation of all the codecs with the
last GCC, the possibility to move the about box with Xaaes, informations
about the licence, etc...
- Many problems on others OS that MiNT are corrected, for exemple, the
plugins were not loaded if this ones were in the global folder (aka
"LDGPATH/codecs") under TOS and MagiC, etc etc...
- Problems with some degas images fixed.
- With the DSP, JPG pictures not multiple of 16 were badly decoded.
- In planes < 8 bits, the toolbar's icons was not shown.
- VDI's EDDI check at the start.
- Zview saves the browser's coordinates when we quit the application.
Now, this coordinates are not saved if this window is iconified (for
prevent bad browser coordinate on next relaunch).
- Others littles bugs fixes like with the menu bar handling, error
messages no correct, etc etc...

For Use native JPG decoding on ARAnym, you need a fresh version from
CVS; here, you can find a up-to-date "unofficial" winaranym version:(
this version works only on i686, so on PentiumII and greater).

http://the.zorro.free.fr/downloads/winaranym.zip

For zview itself:

http://the.zorro.free.fr/zview.html

Ciao,
Zorro

Hi Folks!

Decided to get back in to the Atari scene again and would like to build up the kind of machine I always wanted back in the early 90's. So....

Does anybody have a Mega STe they wish to sell?
For the moment, I'm only interested in the base unit with SCSI board, keyboard & mouse. However, it must be fully working and be in excellent condition with no yellowing to the case/keys.

Please mail me with spec / price (Inc P&P)

Cheers,
Dave

FYI, the StrongARM is not superscalar. I'm not sure if later ARMs (ARM10 or ARM11) are/will be. However, that would kind of surprise me since ARM procs aim for low power consumption.

It works now. Seems a little sluggish but it could just be down to my GFX card not being very fast. Looks great though.

576. About Mega ST and AT-Speed C-16

Newsgroup: comp.sys.atari.st
Date: 2005-02-21 21:55:24 UTC
From: Stephane Perez <sperez@!no_spam!free.fr>
Message-ID: <Xns9604E92A07132sperezfreefr@212.27.42.69>
Source record: 14651

Hello,

I have some questions about a Mega ST4 someone gave me and an AT-Speed C-16. Here is a photo of the whole thing :
http://strider.mjjprod.free.fr/_temp_/mega_st_vue_generale.jpg

- Can anyone give me information about the AT-Speed C-16 card? How to plug it, how to run it, which software using, etc.

- What are the two green wires and the kind of power wires (red & black) soldered to the AT-Speed? Here is the picture :
http://strider.mjjprod.free.fr/_temp_/mega_st_atspeed.jpg

- Now about the Mega ST. On the case it is written "Mega ST4" so I presume it is a 4-Meg machine? But I ran several system tools (Sysinfo...) and they all tell me it is a 2-Meg machine! Here is the photo of the motherboard:
http://strider.mjjprod.free.fr/_temp_/mega_st_ram.jpg

- On the same picture, there are 4 free slots (EPROMS?) on the left (below the MC 68000). Do you know what is it?

- Just below the power supply there is a free slot, as you can see on this picture: http://strider.mjjprod.free.fr/_temp_/mega_st_alim.jpg
The right slot is used to feed the motherboard, but what about the left one? Maybe for feeding the expansion card?

- Last but not least :) what's the J17 jumper?
The picture: http://strider.mjjprod.free.fr/_temp_/mega_st_j17.jpg

Thanks for your help.
St&#65533;phane

OK, I finally got around to checking on my Falcon where it works
flawlessly: I'm running MagiC 6.20, and I'm quite sure the above
mentioned bug in Pexec() was fixed _after_ 6.01. Maybe you should
consider updating.

Ciao

Thomas

The STFM and STe use the same monitors. If the monitor works on one
but not the other, I can think of no reason other than a faulty port.

Galen

Since multitasking is very convenient, I would recommend Geneva or Magic. Since both load off of disk, one still has TOS around for gaming.

Hi Thomas,
Yes, I've been considering upgrading for some time, but I've been
trying to find an easy way to obtain the upgrade. Hopefully
upgrading will fix the problem. I've just been booting without the
cache on, and that works fine for now.
Thanks!

Sam, my understanding is that a regular phone line will *not* work, even
though it looks close.

> Question #2: If that is not possible, what can I do?

You can buy longer Mega ST keyboard cables from some place such as Best
Electronics.

That was an estimate based on the price that I have seen these things go for. Full dongled versions of Cubase and Notator can be extremely expensive.

Coda.

Hi All,

I have a MegaST keyboard and Keith Scroggins' MegaST keyboard falcon adapter, wihich works great btw!!!!!

Question #1: Can a phone line (such as that which connects a modem to the phone outlet) and a coupler be used to extend the length of the MegaST's cable?

Question #2: If that is not possible, what can I do?

I have re-cased my Falcon's motherboard in a large (30" I think) tower case, but the MegaST keyboard cable is definitely way to short to reach from the Falcon to the computer desk....help!!

Thanks everybody!!!!!!!!! :)

Hello,

I am currently trying to add Blowup/ScreenBlaster/etc... support on
Falcon for SDL. Atm, only BlowUp and ScreenBlaster 3 (not 2!).
If you have any of these extensions, could you please try the progs in
this archive:
http://membres.lycos.fr/pmandin/download/video1.zip

One display the video mode list (vidinfo.ftp), the other displays smileys
in the chosen resolution (-width <x> -height <y> for command line params).

Or you can buy a cable and connect appropriate male and female plug to it.
There are only 4 wires used, if I remember correctly (Vcc, GND, TxD, RxD
are the essential ones at least).

Regards,

Alexander

A normal phone cable won't work as the MegaST needs all pins connected.
Best thing you can do is either buy a longer one, as Ronald suggests,
or you can get two RJ-11 plugs and some telephone cable and, providing
you can get the relevant pin-outs, make your own cable.

Hallo Sam!

S>Question #1: Can a phone line (such as that which connects a modem to
S>the phone outlet) and a coupler be used to extend the length of the
S>MegaST's cable?

This should be possible, as long as pins 2, 3, 4 and 5 are connected straight
through.

From Chips 'n Chips hypertext:

Die Belegung der Tastaturbuchse am MegaST(E)/TT030

1 +5V DC
2 +5V DC
3 Transmit Data
4 Receive Data
5 Ground
6 Ground

The +5V and Ground lines are there twice, but needed only once. Check your
cable with a little multimeter that there are no crossed wires or such, and try
it out.

With best regards
Ekkehard

How about a 68000 -with- a (memory-mapped) FPU :)

It is a rare but not impossible configuration- e.g. I have it on my Mega.

Well, the 68000 version exists only because I will make a library for to
use the zview's codecs.

Don't expect that zview will be useable on a 68000(a CT2 is the minimum).

If you want absolutly a 68000+FPU version, you can try to compile it
yourself with the -m68000 -m68881 options.

Best regards,
Zorro

In the UK we have 6 way male female extension cables, 2 -3 metres, work a
treat.

Yes, it will work, provided that it is a cable with four wires, and
that they are all connected, and no, Mega does not need all
pins connected. Connectors on the Mega keyboard cable have more pins,
but the outside two are the doubled power supplies which you can do without.

>http://strider.mjjprod.free.fr/_temp_/mega_st_ram.jpg

This photo indeed shows that all DRAM chips are in place and this should
be a 4MB machine. For the upper 2MB to work, the following items should
also be completely functional (find and see the schematics): the upper 2MB
are the two DRAM rows nearer the centre of the board. There should not be
missing any of the 33 ohm resistors near the middle of the front side of
the board. Left of the resistors there are two 74LS244 or (better) 74F244
chips. Towards the centre of the board there are two 74**244 and two 74**373
(again LS or, better, F). Sixteen data lines should go from the 'left'
memory banks to these chips. There should also be 10 multiplexed-address
lines (MAD0-MAD9) going from the MMU (a PLCC chip in the forward left corner)
to the DRAMs. As the lower 2MB appear to work, check especially the
multiplexed address line MAD9; pins on the PLCC chips like the MMU
sometime tend to loose contact. Also the control signals RAS1, CAS1L and
CAS1H from the MMU to the two 74*244 in the front, and then, buffered by
the '244s, through those resistors to the memory banks.

Check if some of the above is missing or badly done.

>- On the same picture, there are 4 free slots (EPROMS?) on the left (below
>the MC 68000). Do you know what is it?

Yes, they are for EPROMs; if you upgrade TOS (e.g. to TOS 1.4, if you do
not have it) you will have to use six 27C256 EPROMs. Tou will also have to
change some jumpers and cut a trace on the motherboard (all in the front
left corner of the board)

>- Just below the power supply there is a free slot, as you can see on this
>picture: http://strider.mjjprod.free.fr/_temp_/mega_st_alim.jpg
>The right slot is used to feed the motherboard, but what about the left
>one? Maybe for feeding the expansion card?

Yes, or for feeding an internal hard disk, or whatever. It is identical
to the one used to feed power to the motherboard, i.e. it contains +5V,
ground and +12V.

>- Last but not least :) what's the J17 jumper?
>The picture: http://strider.mjjprod.free.fr/_temp_/mega_st_j17.jpg

These are not jumpers but a connector for an internal hard disk.
It is functionally identical to the 19-pin ACSI port on the rear,

but pin disposition is different. You will have to have a
suitable (small in size) ACSI-SCSI host adapter between this
connector and a SCSI hard disk.

Hi, Augustus!

A> What is "Geneva" OS?

Geneva is a cooperative multitasking AES (GEM) replacement. It is small
and fast and therefore a good choice for 1MB ST models.

A> Geneva is free, or not?

No, Geneva is commercial.

A> where do I found it?

Try google or something thelike. Sorry, I have no URL at hand.

Regards,

Alexander

Thanks! I have Geneva and MagoC 5. I don't know whith OS are better for my
Mega STe (4MB ram).
MagiC work good, but I didn't installed Geneva jet.
What do You think about?
And whith "Desktop" now is "on top"? ;-)

602. Overscan for Mega STe?

Newsgroup: comp.sys.atari.st

I have Overscan (for ST) and it dosn't work on Mega STe. Where I found
overscan (or etc.) for my comp?
I read (1990-92 ... ;-)))) about "home-making" overscans etc....

I thought you said you had both MagiC and Geneva later in this thread,
so why all the questions when you obviously know what it is?
In any case, here's the URL for Geneva:
http://www4.pair.com/gribnif/geneva.htm

Personally I prefer MagiC.

AFAIR, one of the signals (from memory: DE?) that need to be cut and
modified for the overscan mod is not available in the STE, since two chips
were merged into one bigger. I do not remember any working overscan mod for
STEs - anyone?

Source record: 14685

Yesterday I've bought a Atari Mega STE. I don't know what simm modules must be used in the STE, but I found 2 pair of simm's in it.

The first pair has 2 ic's with the code: TC514400ASJ-70 and one with: TC511000A-J70

The second pair has 8 ic's with the code: TMS4C1024-80N

Is this the correct setting?

Greetings,

Mario

When I spoke to the chap in the Palace of Culture & Science in Warszawa about the Atari they have on display there, he said it was very popular in the past and is still reasonably popular?

It could just be rubbish he speaks for tourists though ;)

Egon

Source record: 14689

Hello Mario,

MK> Yesterday I've bought a Atari Mega STE

Nice machine that. Did it come with a hard disk?

MK> The first pair has 2 ic's with the code: TC514400ASJ-70

Those will be 1M x 4 bits each.

MK> and one with: TC511000A-J70

1M x 1 bit, used to store parity information in some microcomputers,
but probably ignored in the MegaSTE. Each of these two SIMMs are 1M x
one byte wide, so this first pair gives you 2 Megabytes

MK> The second pair has 8 ic's with the code: TMS4C1024-80N

Those chips are 1M x 1 bit each, so the second pair of SIMMs are also
1M x one byte wide, giving you another 2 Megabytes.

MK> Is this the correct setting?

Sounds reasonable. I wouldn't be surprised to learn that 4 Megabytes
was the maximum on a stock MegaSTE. The speeds look about right too.

Hope this helps,
- Andy Ball

I once upgraded an Atari PC, which freed up some 256K x 4
bit DRAM chips that the PC's owner then gave to me. I used
them to upgrade one of my STFMs to 1 Megabyte of RAM.

I really like the high-res mono mode, especially on the pin-sharp Atari SM125 that I used to use. I don't think I have tried an SM144, but I'm glad that you got the mono monitor.

There are new instructions (for instance, there are long multiplication
instructions 32x32->64), there's a longer pipeline (5 stage), a bigger
on-die cache (16 KB), it doesn't even consume 1 Watt at 200 MHz and so
doesn't need any fan for thermal dissipation (this why you can find so
many PDAs equipped with it). Intel have had a "deal" with DEC/Compaq to
get the StrongARM design and claim this is their own IP. They now call
it the XScale family (and performance varies considerably from one to
another).

Hello Galen,

G> It would be nice if single gun (monochrome) monitors
> were easier to find. The picture is certainly clearer.

I agree. They are still being made, but because it's now considered a 'niche market' the prices seem to be creeping upwards. Second-hand ones can be found, but then you're up against life-span issues.

If you want some with a 220V/50Hz PSU: they go real cheap here in
Germany, as they were commonly used.

SM124 was used as a bank monitor. I had one regunned by a tube rebuilder, using a left-over NCR bank machine monitor gun. One version of the color monitor was also used as an NCR bank machine monitor, before being attached to an Atari.

The rest of it works like a TV set.

NCR does have, but will not find, the bases they stuck on SM124 cases. I tried. The quality person at the production plant could look up the part number, but refused to. Not his job.

Depending on funding and persistance, a mono monitor can be made to last nearly forever. y

636. TeraDesk 3.50 released

Newsgroup: comp.sys.atari.st
Date: 2005-02-27 10:33:28 UTC
From: vdjole@EUnet.yu
Message-ID: <cvs7lmjfq1@news.eunet.yu>
Source record: 14613

After a delay, caused by temporary inacessibility of the server on which the web page resides, version 3.50 of TeraDesk open-source desktop is available at:

http://solair.eunet.yu/~vdjole/teradesk.htm

TeraDesk is currently the only open-souce desktop available for 16-bit and 32-bit Atari computers. Developers' goal has been to maintain TeraDesk as a small, simple, fast and reliable desktop, which would be functional and competetive in the modern multitasking environments and all flavours and versions of TOS-compatible operating system(s), while keeping, as much as reasonable, familiarity with the original TOS desktop.

Several new features have been added since the last published version, and also some bug-fixes. See the history file for details.

Have fun.

I recently upgraded with the latest patch to .004 for Neodesk4 and now the Install/remove desktop icon dialog does not appear except briefly and then goes blank with the cursor flashing. All other panels, dialogs and drop down menus work correctly.

Just to be sure that no mixed files between versions were being used I reinstalled all of Neodesk 4 and still the same thing. Do anyone have any ideas what's going on?

640. File conversions needed

Newsgroup: comp.sys.atari.st
Date: 2005-02-27 22:17:09 UTC
From: Ken Springer <wordworks@greeleynet.com>
Message-ID: <42224499$0$42482$75868355@news.frii.net>
Source record: 14617

Hi, All,

It's been months since I've visited this newsgroup. Not for wanting to be here, but because I moved. Since then, I've yet to get a single computer system completely reassembled. :-(

Sadly, that includes both my TT and Hades.

Now I find myself need some Outline Art and CVG (Calamus) files converted for work. So today I hurriedly set up the TT to convert them, and the boot disk is either dead or something else is wrong with the TT. (Hard drive spins but nothing but a blank desktop.) And I don't have the time today to set up the Hades. Besides, I know the software I need is on the TT as that is where I created the files, but the software may not be on the Hades.

But I was smart, way back then, and put the actual files on a Zip disk. :-)

The files can be found at http://www.greeleynet.com/~wordwork/Friends/. This will give you a directory with 3 *.ol and 2 *.cvg files.

I would appreciate it if anyone could convert those files to WMF (windows metafiles) and send them to this email address before Monday morning Colorado, USA time. GEM files might be OK, but I've got to go through some boxes of books to find my Corel Draw 4 manual. If I find the manual, I'll have the serical number and can install CD 4 on this Windows 98 machine and then convert to WMF from there.

But WMF is really the preferred file format with the short time I have to deal with the issue.

Thanks a bunch.

Ken

643. Re: Atari-formatted DD disks on PCs again

Newsgroup: comp.sys.atari.st
Date: 2005-02-28 17:20:44 UTC
From: Jim DeClercq <jimd@panix3.panix.com>
Message-ID: <cvvjtcjgq1@reader2.panix.com>
Source record: 14620

Other than on Windows 95, which is different because Microslop wanted to make a disk distribution of windows using 1.62 meg disks, so that it actually follows the so-called Microsoft Boot Sector Standard, and could read anything, I wind up formatting a disk in the PC involved, and finding that both my TT and an ST with a high density drive fitted, will read it.

The converse is not true, for most PC machines. And, if you leave the disk in the PC drive too long, it writes its file structure over the Atari file structure, and the Atari will no longer read that disk. That does depend on which operating system. I am using windoze XP at work and a TT at home, and most of what the PC is good for is finding files for my Atari computers.

My work machine does have a command prompt on its start menu, and a DD disk formatted that way reads in both the machine that wrote it, and in Atari machines.

I personally have had no luck trying to read an Atari-formatted disk on a Windoze machine. That may be because my workplace(s) keep "upgrading" computers.

My current personal project involved reading a DVD of Atari stuff in my work machine, and moving it to where I can write a CD on my home machine on floppy disks. Have parts on order to make up a SCSI DVD reader, but the writing program has not yet been promised. Takes an IDE drive, a bridge card, and a box to put it all in. The bridge card is the expensive part.

Jim

: > the command:
: >
: > Format a: /u /t:80 /n:9
: >

: This formats double sided. I am pretty sure you can make a single sided
: drive that can be read on a PC can be created on an old ST using something
: like FASTCOPY. The ST FORMAT magazine used to come with double sided disks
: where most of the stuff was on the first side and could be read on an old
: ST. There was then a folder that could only be opened on a dual sided
: machine. Not sure how this was created but it must be possible.
: I wonder if an old FORMAT command from say NT3.51 would format 360K floppies
: on a 2000 or XP PC. (/1 option).

: >

: An external drive will usually be double sided. You can also replace the
: internal drive but this may require a little surery to the case.
: If you want to keep your ST mint this may not be desirable.

: > I don't know how much people are using a real ST. A ST is very cheap, but

: > share MID files when you are having an older ST.
: >

: I think many people are using a real ST, or at least Mega STE, TT or Falcon.
: However most of these will read 1.44 floppies.

: > I'm looking for a hardwaresolution, so i can use my older ST a long long
: > time.
: >

: You could try a drive transplant as above, or an external drive. If you have
: both a PC and an ST you can also use "Networking" to transfer software. You
: could build an ETHERNET interface (hardware.atari.org). If you only want to
: transfer small files you could use a serial cable and slip/ppp. In both
: these case you would be using "Real" networking. I have an ETHERNEC (and a
: hard drive but thhats not needed) and use FTP to transfer files -
: http://www.dwade.freeserve.co.uk/atari/main.html has details

: Alternativley you could use PARCP http://joy.sophics.cz/parcp/ wich uses a
: non-standard protocol, but which works well. In all these cases you would
: have to get some one withh an ST with a double sided drive to copy the
: software to a single sided disk to get you going. (I think all STs can
: format disks single sided, they can certainly all read them). I made the
: cable by chopping the end off a printer cable and soldering a new connector.

: > Greetings,
: >
: > Mario
: >
: >

: Hope the above is helpful,
: Dave.

Perhaps I should clarify. I have sufficient SM124 monitors. What
would be useful would be monochrome XVGA. A single electron gun for
monochrome is sharper than the three color guns, and I believe that
some folk (like myself) would happily use a small monochrome monitor.
1600x1200 is a bit fuzzy on my 19 inch monitor (so I use 1280x960), but
1600x1200 could be very sharp on a 17" monochrome.

Hi All,

I don't think the problem is Mint (1.16.1) as much as it might be Xaaes.

The problem....my Falcon reboots right after it's loaded Mint and tries to load Xaaes. I can't for the life of me figure out why it's rebooting. I don't know what's wrong the the Xaaes config, I've pretty much gone with the configuration that comes with Xaaes. The only changes I made were the video mode (set at 26), and activating the desktop path for Thing.

Anybody got any ideas? I'm just fooling around with Mint until I get Magic 6.0.

Thanks,

SamF.

Ken,

Just a guess, maybe a corrupt desktop file. See if you can boot from
another floppy (ICD, HDDriver) and rename/delete the destop file.

This has happened to me before and sometimies it works.

Rory

Or it could be a corrupt HDDRIVER.SYS file, or a bad hard drive. Been
through this all before.

Thanks for the suggestion, tho'.

I've got the floppy somewhere in all the computer stuff I've not sorted out
since moving.

And I got around the conversion problem a different way.

Hi,

Is somebody keen on building GCC 3.4 for ATARI.
First step would be the compilator CC1.TTP.

Best regards,

Drive from E-Bay, anything IDE that will read and write DVDs. Reading
an ISO file system might work. Bridge card from A-Card, or acard, local
(us) distributor, costing about 80 USD.

Big problem is drive time to work. The US is a big country, and 100 miles
to work in Europe would cover several countries, but take more time. As it
is, about two hours a day for myself, and so far have found better things
to do that put it all together and try it out.

Jim

As it

I used to commute 100 miles to work, took three and a half hours by
train, or an hour and a half by Motorcycle. Oh and I stayed in the same
country all the time ;-)

I see each State in the US like its own seperate country. Then they're
about as big as they are over here...

Coda.

Thanks very much but I think that zweather needs many others features to
be good like weatherbug.(for exemple city map.. maybe in the next Beta
release =)

> Question: Can the degrees be displayed in Fahrenheit?

Of course. You can set the data in metric(kilometers, celsius, etc) or
in imperial format(miles, Fahrenheit, etc).

> Thanks and keep up the great work!!!!!!!!

Thanks! It's really motivating.

Ciao,
Zorro

666. ST floppy drive maintenance or replacement

Newsgroup: comp.sys.atari.st

Can someone point me to some good instructions for converting PC floppy drives for use in an ST?

I have had two of my original ST drives go junk on me recently. I'm wondering if maybe my ancient floppys are starting to shed their magnetic coating and that is gumming up the heads. I know that happens with old audio tapes.

Any tips on how to clean the heads without damaging them?

Hi,

> Can someone point me to some good instructions for converting PC floppy
> drives for use in an ST?

All you have to do is set the drive select to be "0" rather than "1".

Usually one of three ways:
A simple switch.
A set of jumpers.
A solder bridge.

> I have had two of my original ST drives go junk on me recently. I'm
> wondering if maybe my ancient floppys are starting to shed their

>
> Any tips on how to clean the heads without damaging them?

If it is just goo on the heads then a stock head cleaning disc with
accompanying cleaning fluid will do the job.

If you have the early ST FDD with a worm drive for head movement, check that
the worm isn't full of crud too.

Seems you were on the same track as I was. I'm looking to get a Acard
AEC-7720U bridge. Just wanted to know if there was anything else out
there.

:Big problem is drive time to work. The US is a big country, and 100 miles
:to work in Europe would cover several countries, but take more time. As it

And flipping the floppy cable connector upside-down (first, cut off the
notch that prevents this from being done).
You might also have to mess around with the disk-detect switch, at least
I had to do both these things in addition to the 0/1 select, and I've
documented the whole thing here with text and illustrations:

ftp://gem.win.co.nz/hall/hardware/sony_144.zip

I assume that most of the stuff in there can be applied for other
standard PC type floppy disk drives as well.

I've never yet had a drive with an inverse cable set-up.
Pin 1 on the cable has always gone to pin 1 on the drive.

Have you seen many with inverse wiring?

Egon

>
> Thanks,
> Mark
>

Well, I hope that we can find and resolve the problem.

Follow this steps:

1) Install MEM.LDG in your LDG folder.

If you have the LDG system installed, you can know or set it with the
LDG CPX else put it in "c:/gemsys/ldg/".

2) Put the "codecs" folder(and NOT the content of this one) in the same
folder. (Again, c:/gemsys/ldg/ by default).

So, the 'tree' should be:

c:/gemsys/ldg/mem.ldg
/codecs/xxx.ldg
/xxx.ldg
/...

or if you own the LDG system:

LDGPATH/mem.ldg
/codecs/xxx.ldg
/xxx.ldg
/...

3) The current version of zweather doesn't work if it's launched from an
old 8+3 partition... you must put it in a VFAT partition.

4) Do you have a active mintnet connection?

5) Do you use a VDI with a valid EDDI installed (like NVDI > 2.0, fVDI,
NOVA, etc etc)?

If you thing that all is ok, try again to launch zweather, it should be
work flawlessly :)

Ciao,
Zorro

> Have you seen many with inverse wiring?

I discussed these things extensively here a few years ago when I was trying to figure it all out. As with the VGA monitor cable there wasn't any fully compiled and ready to use information on the subject of using high density floppy disk drives with the ST, so I asked around and created the mentioned file. Everybody told me that I had to invert the cable connector, and this was my experience as well, with the Sony drives that I've used.
Being standard PC floppy drives I can't understand why other standard PC drives would be any different.

The original Atari ST drives on the other hand weren't completely standard as far as I know, which is why this had to be done.

My codecs were copied into C:\gemsys\ldg* instead of
C:\gemsys\ldg\codecs* so that's most likely the problem. All other
requirements I am good on. I was using an 8.3 partition but I can just as
easily use vfat and I'll try that if I continue to have problems. Thanks :)

Hey guys,

I realize that when I evaluate programs I don't often post compliments but instead complaints. With GIM however I have no complaints and no compliments except for the complaint that it doesn't run under MagiC. So I was really wondering if people care about this program? Right now it does all I need it to do so if nobody else cares I'll probably cease development on it.

For those interested, sparemint update manager is coming along quite nicely. I got the progress bar routines into a working state but I have to further plan the design as I didn't do this properly. This will require a heavy amount of completely redoing my work, but it'll be worth it. In the beginning before you do much of anything it's tough to decide on a function layout or a workflow ;)

Thanks,
Mark

Are you foolish? Of course that the atarians like it !

But if I can give you 2 tips:

1) Don't expect user's report with the first versions, on Atari, there
are many bad/unuseful/unstable softwares around so the users are
'afraid' to use it... Myself with zview, I awaited the beta 3 before to
have the first reports.

2) Don't forget that the bottle is more important that the water.
I mean that for a normal user and even for me, the GUI must be more
'appealing' and 'sexy'... remove debug output, add cool features like
buddies' icons, add the possibility to iconify the chat window, etc...
and your application will be a "must have"!

Even if it's a 0.3 release, I like your applications, I use it and it's
a shame that I didn't made a user's report before, now I regret :/

Please, don't cease the development and continue your good work.

Hi, Martin,

I think I may have it covered with the Photoline program George mentioned.
I'm downloading both Windows and Mac versions, since I have both OS's here.

I'd much rather find the time to get the TT going. :-)

Hi, George,

Photoline 32 worked like a champ. I wasn't too surprised to find it even listed CVG until I saw who owned the program, ComputerInsel. They supported a lot of Atari software, including providing the driver for the graphic card in my Hades. NOVA drivers, come to think about it.

I wouldn't be surprised if they also did the PhotoLine availabe for Atari's. I'll look when find the manual.

Now all I have to do is convert the Outline Art files.

I just checked it, and unfortunately you're right.
I've uploaded it again, and it should work now:

ftp://gem.win.co.nz/hall/hardware/sony_144.zip

(I also included .GIF versions of the previously only .IMG images, which might come in handy for people using PCs -but if you do want to view Atari .IMG images you can download a very nice and free program called "XNview": http://perso.wanadoo.fr/pierre.g/xnview/enhome.html)

For Macs you can use a shareware program called "Graphic converter" for viewing .IMG files: http://www.lemkesoft.de/en/graphcon.htm

PS. when reding the file contents, disregard the stuff about how to use it in high-density mode. The switch method doesn't work (I've tried it) and I haven't had time to try out the DIY circuit projects which I've collected recently though I plan to make use of one of them in time.

The documentation however is correct when it comes to making a standard PC style disk drive work in the ST as a replacement. It'll then work in DD mode (720 Kbytes, double-density).

To be honest, "it should work" with MagiCNet but it's untested.

In any case, the compatibility with the sting's stack should be added in
the next BETA.

Yeah, those Teac drives are pretty flexible. Unfortunately they're not widely available any longer. Actually, my experience is that when you go to a PC store (or online PC store) and ask for a floppy disk drive they don't even have the make/model number available. You have to ask them to pick it up and physically look at it to find out.

I'm pretty happy with that Sony drive of mine since it has a zero-Ohm resistor soldered in place and marked for drive 0/1. I'm not sure if all drives have that option, so it might be a gamble to find one that'll work without problems on the ST.

Ok :) Well Sparemint must take priority now. I held a vote and pretty
overwhelmingly, people asked me to work on sparemint website and update
manager over GIM, but enough people did ask me to work on GIM to make it
very relevant. A lot of issue is me not knowing how to do certain things,

your code is open source and uses a lot of good visual elements so it gives me ideas on how to do things :)

Thanks,
Mark

Put it this way, I've tried A LOT of drives in the past, the MPF920 comes up
TOP, and although the older model drives had a jumper link, the 920 does
have a PCB jumper link.. Most PC drives laugh at anything over "normal
format", most PC drives dont have a jumper link at all..
What can I say apart from the MPF920 is my perfect partner ;-)

From what I remember, some drives didn't have the notch cutout on the PCB,
which was the reason for filing it off..... Cables otherwise fit first time
and worked every time, never really took much notice TBH....

>
>Have you seen many with inverse wiring?

Something else is the matter here: contrary to most floppy drives,
on which 'Pin 1' on the 34-pin flat-cable connector is the one nearer
to the power-supply connector of the floppy drive, drives used on early
STs had 'Pin 1' on the side further from the power supply connector.
But still, 'Pin 1' on the cable went to 'Pin 1' on the drive. The notch
on the connector might have been on the wrong side, though; I don't
remember.

That meant that the flat cable leading from the motherboard to the
floppy drive had to be twisted 180 degrees in order to mate it to
the drive. That cable sometimes being quite short, and space in
the box being limited, it made problems and did not look nice.

Btw. occasionally one -does- come upon an odd PC floppy drive which has
the flat-cable connector turned around, same as on ST drives. It is
best to check for 'Pin 1' mark on the floppy drive PCB.

Bbtw. if the ST is the one using a HD floppy drive, the replacement drive
should preferable be the one which (can be configured to) output
'HD inserted' signal on Pin 2. Not all PC drives can do so, jumper or no
jumper.

I think i get it now, all this inverted stuff is referring to connector
being physical inverse in its orientation and not that the pins are reversed
so that pin1=pin33.

I don't know nothing about RGEMsocket because I don't speak this tongue :/

[Off Topic]
I wonder why many Atari's websites from Germany are only in German?

It's very bothering especially on ones with good softwares like RGFSoft.

The worse example was www.tosgroup.org, they wanted to define "news
standards for TOS" but only in German, in their case, it was
disrespectful towards the 'foreign coders'.

Hi,

I was wondering if the CT63 can be modified to have the motherboard acceleration as the CT60 contains.

Does it have the pads to solder these parts or will they have to be fitted on another PC board?

Rory

Thank you Hallvard. I got your file OK and the info is exactly what I
wanted .

Newegg has new Sony MFP920 drives for $9. I think I will stock up on a
few.

Anyone know if it is possible to read a memory stick with an Atari? If
there are any SCSI interfaces around for solid state memory it might be
feasable. You could pack a lot of Atari programs and data onto a
128mb card.

708. I have CT60 problems, too :(

Newsgroup: comp.sys.atari.st
Date: 2005-03-05 04:22:20 UTC
From: mail@freeman-studio.com
Message-ID: <1109996540.222403.64940@z14g2000cwz.googlegroups.com>
Source record: 14585

Hello,

I finally got a 68060 to put into my CT60. I installed it per the instructions, booted up, and had various problems, depending on what OS I booted into.

1. I tried on a completely clean system (holding down control while booting), and it would work for a few seconds, then would freeze while drawing something on-screen (like, if I hold down a window scroll button, it would scroll for a while, then freeze while in the middle of drawing an icon, for example).

2. I then tried booting into a fairly clean Magic system, and everything worked perfectly. But when I tried to install all of my system programs, I discovered that it did not like the Nemesis speed-setting program. It didn't have any issues with the Nemesis driver (NEMESIS.PRG), but wouldn't run the speed setting programs (NEM_LO.PRG and NEM_HI.PRG). It would crash with either two or four bombs, or draw short, white, vertical lines about 1/4 way down the screen.

3. I tried booting with the CT60 turned off (with the jumper placed on the proper CT60 pins), and it booted, but didn't recognize my SCSI hard drive at all. I tried the Nemesis programs from a floppy, though, and they worked fine here.

4. So I took the jumper off and tried with the CT60 on again, and played with program settings (with/without TT-RAM, etc.) and NVRAM settings (cache delays, etc.). I eventually tried setting the "TOS in RAM" setting to "No" (I forget if that's the exact wording, but close enough). After rebooting, I get the text declaring that it's a Falcon 030/CT60 and recognizes the SD-RAM, but it doesn't display the Fuji symbol, doesn't say what version of "Boot" it has (i.e. Boot 1.01) or whether ort not the keyboard is ok, and it completely freezes. Sometimes, it puts a small line of randomly-dotted colors somewhere on the screen.

So, it looks like something is completely screwed up. I now have a non-functional CT60 that I cannot make any changes to because it won't boot. I've tried the mentioned key-combinations for reseting NVRAM, but they don't seem to do anything. Any ideas short of sending the thing back?

Thanks!

Mike Freeman

> about as big as they are over here...

No offense intended, Coda, but I read this statement and it gave me a chuckle. In a way, your perception of each state being a country isn't really that far from true. In fact, it's very close to what the original signers of the Declaration of Independence had in mind when the US operated under the Articles of Confederation before the Constitution.

As for size... I live in the state of Colorado. In the north central part of the mountains is a large valley called North Park. It is bigger than the state of Rhode Island. And South Park, another valley, is bigger still. :-)

Just some useless trivia! LOL

Ken

Well, the blitter seems not works, try to remove the clock patchs.
The best way is to read the CT60 installation poge from the Rodolphe's
site :

" Verify you see no 74F08 soldered (added) on the clock trace near the
SDMA chip. If yes, you must remove this 74F08 and connect again the
clock trace (that was cutted for this 74F08).
On the GAL U63 (left of the NVRAM) : - If you see a component 74F08 or
74F04ï¿½ with some wires connected on the resistor places R216, R217, R221
& R222, you must remove this component and the wires. Solder the three
33 ohms SMT resistors (furnished) on R216, R221 & R222 places. - If you
have no 74F08 or 04 on U63, you have to verify all the three resistors
R216, R221 & R222 are well 33 ohms marked 330 or 33R). On some
motherboards, one of them can be a 0 ohm (marked 0 or 0R0) : replace it
with a 33 ohms. "

If you can't fix the problem yourself, contact Rodolphe.

Regards,

Didier.

Hi,

I have updated my site about the CT60 programmable clock :
http://perso.wanadoo.fr/didierm/ct60/pclock-e.htm
For the TOS (v1.03a) you must wait than the Dallas DS1085Z-50 chip
features selected by Rodolphe for the CTCM (less expensive than the
Cypress CY27EE16 used on the German module) are tested (all is ready :
TOS, CPX and HYP documentation).
The TOS and the CPX supports the two chips, backward compatibility
needed.

Regards,

Didier.

Hi,

> [Off Topic]
> I wonder why many Atari's websites from Germany are only in German?

Because it is much mor easy for a german to write a german text? Thats exactly the reason for me to write my Atari programing site in german. For work done in my spare time i dont want to fight against my bad english.

> The worse example was www.tosgroup.org, they wanted to define "news
> standards for TOS" but only in German, in their case, it was
> disrespectful towards the 'foreign coders'.

I was also missing some depth in some of their documents. But the documents (TORG) from Tosgroup should contain an english part. It is only the web site which needs an additional english part.

> fitted on another PC board?

YES, pads are here and you have just to solder some SO chips and some few
SMT resistors and condensators around them...

I will do a note about that if some of CT63 users really want to solder
them...

The temp function is possible too BUT the SDR chip must be programmed with
the good version.
The CT63 version of SDR outputs always a 1111 1111 value for the CPX .
TLV0831CD can be ordered as samples on TI web site ...
2 resistors 1% have to be added around the TLV.

Regards

> fosc/2, or is it similarly configurable?

YES and no...

In fact the 68040 runs at *2 internally but only for logic between cache and units (1 integer and 1 floatting).

For a 25 MHz 040, there is a 25 MHz clock as BCLK (Bus clock) that enters... this clock is more than the bus clock; it is clocking 80% of the 040 !

BCLK is called CLKEN/ on 060.
It is why you have to delay BCLK about 5ns to use it as a clock enable signal... it enables the rising edges of the other clock of the 060, the PCLK !
So, with this BCLK delayed, yu get a signal enabling the rising edges of the PCLK, 1 time among 2 = /2 clocking on the bus interface.
The 060 clocks only on rising edge...never falling...
And you can delay as you want between 2 rising edges...You can even stop clocking...it will not lost the contents !!
It is a STATIC processor...

So, the other clock of the 040 is the PCLK, called CLK on 060.
This one is BCLK*2.
If I well remember, it is only the logic that is clocked at *2 ! So the 040 do math at BCLK speed, not PCLK !

It is why when you replace a 040 by a 060....you get *2 for the CLK used instead of BCLK to clock the CPU units and *2 for the performances beacause 060 has 2 integer units instead of 1 !!

So, the average gain is 3 (not 2*2 !) because of the instruction pipelining by example...

So, 060 at 50 MHz = 3* (040 at 25 MHz).

Regards

718. JTAG cable info request for CT60

Hello all CT60 users

I read on DHS that a guy received a JTAG cable from www.seytronix.com (seems no working now)...for 25$.
It works fine for CT60 and TOS machine after swap pin #10 & 13 and reorganize the JTAG pins...

I'd like to contact this guy named NEO NG on DHS.

Thanks

Doing a quick search I find several variants of the Sony MPF920 drive
with various letters or numbers (F,L,Z, 1, etc.) after the MPF920
designation. Are there only specific ones that will work as ST
replacements, or are any of them viable possibilities?

Hmmm, not sure which revision mine are but they work great.... bascially any
PC drive will work, BUT you have to locate the drive 0/1 select line, they
used have have jumper links on the back of the drive in the good old days,
on some drives (like the 920) have a solder link which you can alter... pot
luck really if your choosen drive has it or not....

723. Re: Atari-formatted DD disks on PCs again

Newsgroup: comp.sys.atari.st
Date: 2005-03-06 00:24:07 UTC
From: Ken Springer <wordworks@greeleynet.com>
Message-ID: <422a4dcf$0$42488$75868355@news.frii.net>
Source record: 14499

This turned into a real long post on the subject of DD floppies. If you are not interested in that subject, please don't read it.

And a minor error on my part, I hit the wrong reply button and accidentally sent this to xlator rather than posting to the group. Tis was written the evening of Mar. 4.

As I noted in my post about file conversions, I haven't been around for a long time. Moving to a house that needs lots of tender loving care, etc. takes a lot of time. I hope to be here more often now.

This post is going to be a group of comments replying to things I've seen in this whole thread. So don't look here for cut and paste of original messages.

Regarding the Win2K and the disk reading problems:

If you're having problems, are you the one with adminstrator rights on these computers? Or are you just a user? The administrator has rights the user can do, and complete control over what the user can do. The administrator is pretty much God, and you are his servant. :-) This probably also applies to XP Home and XP Pro.

Also, a lot of the current motherboards have lots of options for feature available to the OS after bootup. You can completely eliminate floppy driver use in it's entirety if you want. And definitely change the boot order. That's how you get the new windows machines to boot from the CD Rom.

When it comes to writing to the floppies, I wouldn't write to a floppy disk you want to use on the Atari with any Windows OS starting with Win95 with SR2 installed. SR2 is when they switched from the FAT 16 file system to FAT 32. SR1, and I think the original release, let you choose between FAT 16 and FAT 32. If memory serves, you could start with FAT 16, and then later go to FAT 32 if you wanted. But you couldn't do the reverse.

You should be able to write to the floppies with Windows up to and including 98. But be prepared to see all kinds of strange 0 byte entries in the directory that you may or may not be able to delete. That was my experience. I used the Atari desktop and Neodesk/Geneva. I don't know how Magic and Mint and ?????? will react.

However, I'd suggest you find an old ZIP 100 mg drive for your Atari (assuming you can do SCSI on your Atari, and can find a SCSI ZIP drive) and a ZIP drive of some type you can put on your windows machine that will read and write the 100 meg ZIP disks. I've carried this idea even to a Power Mac 6500 with OS 9.1, and an old Windows 3.11/DOS 6.22 machine. The only computer I have where this isn't up and running is this XP machine, which

will eventually have Red Hat Linux coexisting on it.

The post about non standard formatting of a floppy to other than to the "standard" numbers of tracks and sectors, the Win machines will croak. However, if you can find some really, really old hardware that probably came new with DOS 3.X and older, you'll find some that will read those disks, and also format the nonstandard numbers of tracks and sectors. But the DOS world apparently seemed to quickly find out that all that variability was causing problems. Users who tried to transfer data from one machine to another couldn't. Unhappy campers there. I remember reading numerous "how to's" to solve this problem. My first experience with DOS was at the stage where the manuals told you how to use the t: and n: parameters to format the nonstandard disk, but the OS provided had disabled that ability. But sure had fun giving my DOS friend disks they could read, but not write too!!!!! LOL

Somebody mentioned the boot record and ID stuff on floppies. Correct. There were a number of third party file selectors that let you do that. I think all of the following let you do that: Dave Small (Magic Sac and then Spectre), Double Click, Little Green file selector (the Codeheads), and another file selector that was real popular but I can't remember the name. It was marketed through Rod McDonald of ST Informer.

In one of the messages:

> Pardon my ignorance, but since XP no longer overlies DOS, how do
> I get a command line up on it?

Start Button > Run> (type) command.com <enter>

You can also go Start Button>Programs>Accessories>Command prompt. In 2K, I think it's Start button>Programs>Accessories>System Tools>Command Window (or something like command window. It may actually MS command prompt too. I don't remember from when my work computer had 2K on it.

I haven't seen DD floppies for sale new in stores for a long time. But I'm sitting on a bunch of brand new blanks, and quite a few used ones. But they aren't that hard to find in my experience.

Don't forget that as floppy drives get old, the heads can become misaligned, or the mechanism simply wears out. Misalignment problems were a problem back in the very early days of DOS, both 3.5 and 5.25 units.

::laughing:: I'd forgotten about the old single sided floppies, and the double sided disks with special formating on the other side. I've no idea how this was done either.

Don't forget that TOS is basically a DOS ripoff. The IBM world started with single sided drives also. In fact, for 5.25 floppies, the original DOS disks were 340k, not 360. :-)

Back to file transfers: You could use some old comm software and null modem cables too I'd forgotten about that method. I used it between my ST and Atari 800.

Speaking of formatting DD floppies, I'm reading this newsgroup on my XP machine. I went and dug out a blank DD floppy. It had been formatted using Win 3.1 and DOS 6.21. XP read it. So I copied a couple files to the disk with no problems. Under Windows, it can't format it to DD. I opened the command window. Typed the format command, and XP recognized it as a 720 disk, and reformatted to 720 k. Took the disk to the Mac, formatted it to the old Mac 800k floppy. XP wanted to format it, but couldn't and eventually told me the disk was unuseable. Tried just the format command and XP wanted to format it to 1.44. Told me I couldn't do it. But the manual command given earlier in this thread does indeed work. /u is not needed. If you leave the /u parameter out, all that happens is file allocation tables and FATs are zeroed out. Any files on the disk are left intact. That would allow the Unformat command to work. If you include the /u command, absolutely everything, files and all, are wiped from the disk.

For those that found this post to be boring, I'm sorry for that.

For those that found it interesting, I'm glad of it. Playing with all the old memories, and the formatting experimentation is the most genuine fun I've had on a computer in a very long time.

Long live the Atari!!!!!

Ken

> which needs an additional english part.

Sorry, I have poorly explained.

If you write your website in danish, french or german, evidently, I do
not see any problem... I own myself a website in Italian.

If a coder does similar, it is just sad for the one that wants to use
these softwares but nothing more.

On the other hand, imagine that some french coders and myself create a
website magnificently entitled "TOS group for software standard"... The
final documents will be available in english but all the decisions and
the website itself will be done in french. In your opinion, what will
think the english or german coders?

The Gemlib is made by a french, Highwire mainly by a german, Mintlib by
German/polish, etc etc.. If these libraries/applications(and the
documentations) were only available in the native coder's tongue, it
would be a real f*cking mess.

I agree with myself and it's the most important :)

Ciao,
Zorro

726. New web page UP!!!

Newsgroup: comp.sys.atari.st
Date: 2005-03-06 04:35:38 UTC
From: Carey Christenson <falcon060@adelphia.net>
Message-ID: <RLidnXMBmMsAFbffRVn-3w@adelphia.com>
Source record: 14503

To everyone,
After a long break from the newsgroup. Not because I wanted to but because I had multiple things I wanted to get done before getting back into responding on the newsgroups. Plus I was looking for good newsgroup reader for my MAC. Unfortnately my ISP is making it harder and harder for me to retrieve newsgroup messages with my Falcon. I had to resort to Okami a few months back. And have gotten it to pull in new messages but I cannot respond to any messages at this point not sure what I need to do to fix that. But at the request of many people via my e-mail box. I used to put up an extensive list of URL's to atari web pages. Well, some people liked the fact that I posted this on CSAST twice a month. But the list kept getting bigger and bigger and some people complained about the amount of bandwidth I was using. Some did not mind but others did not like. So after getting my MAC about a year ago I finally decided to see if there was an easy way to make a web page to upload to my ISP. Sure enough I found my answer in Appleworks 6. Now it is as easy as drag and drop and it creates the HTML for me. Although I have to admit I had to learn some HTML to be able to make my front page the way I really wanted it. So, after a few days of having it up and running and adding a bunch of stuff to it, I have decided to hand out the URL. I have some pages to my vehicles and to my CT60 benchmarks as well. Pics of my MAC and of my CT60. I plan to update this quite often and there is even a link to my CAB HOTLIST. So enjoy!!! Here is the URL: http://users.adelphia.net/~falcon060

Thanks,
Carey Christenson
P.S. If anyone ever has a problem with there atari, especially there CT60 I am more than welcome to help. I have had quite alot of experience with my CT60 and know what works and what does not. So just e-mail me at falcon060<at>adelphia<dot>net

replace what is in the <> characters with the appropriate ones.

Thanks

In my experience when I got the CT60 going it also crashed. Do you have all the proper updates for the CPX, Magic and DSPxbios, excep060.prg and CT60xbio.prg??? Also inside of the CONTROL PANEL do you have CT60 Config and General Setup 60?? Because inside of General Setup 60 you can turn the CACHE on and off. In my experience the 68060 is very unstable without the caches on. So if these caches are off you can expect a crash relatively quickly for some reason or another. When I plugged in my CT60 and would play around with it for about 5 minutes it would crash. Much the same way your talking about while redrawing windows or something of that matter. It took me about 4 days then I figured out that the caches were off then it once those were turned on it quit crashing like that. Also one other side note. After all that I would still get a crash once or twice a week. Much more bearable but still not what I wanted. I noticed when I took my 68060 from 66.6666 to 72 mhz it would only crash once or twice a month.

I dont have any experience with Nemesis, especially when related to the CT60. Might wish to contact Rodolphe or Didier on this one.

>
> 3. I tried booting with the CT60 turned off (with the jumper placed on

If I remember right and please correct me if I am wrong. Nemesis low
was for 20 mhz operation and nemesis high was for 24 mhz operation??
What kind of STram board are you using?? It has been said that you need
a high quality STram board for the CT60 to work with Falcon Motherboard
boosting.

>
> 4. So I took the jumper off and tried with the CT60 on again, and

> the screen.

There is a version 1.03a now. You may wish to try the latest updates.
Plus what version of ABE and SDR files are on the CPLD's?? If Rodolphe
put in the ABE and SDR files he will have them labeled on the CPLD's
themselves. I would try booting into 030 mode and see if you can change
that back to TOS IN RAM. It works faster and also more stable. Sounds
like you might have blitter problem. What else did you change on the
CT60 config/BOOT area?? I hope you left the OS alone and the BOOT
alone. Unless your knowledgable on these it is best to leave them at a
stock setting.

>

> mike [at] freeman-studio [dot] com
>

Does the Hard drive sound like it wants to boot at all?? Does the
Floppy light come on?? If it just crashes and nothing happens but you
can see stuff on the screen all is not lost. It would seem that the
NVRAM is ok. Usually if the NVRam has crashed you wont get any video
just a black screen. At least this is what happened in my case. Plus I
could not get anything to boot from the floppy or hard drive in 030 mode
or turbo mode 060. So answer these few questions and maybe we can get
sorted out what is going on.

Thanks,
Carey Christenson

U know, people should use English language as more as possible not because that GERMAN can not read it, but that it is understandable for other nations as well. World is not English and German only.. Perfect example is this mail. Exactly ONE person would understand me, if i would write in my native language. This way all does.

Hallo Mark,

MD>Right now it does all I need it to do so if nobody else cares I'll
MD>probably cease development on it.

I think, your GIM is a very good program. But since I use MagiCMac(X), I
can't use it. So I never wrote you a mail about it. Please continue your
work on GIM.

730. was Atari's MIRAI console a NEO*GEO for the U.S. ?

Newsgroup: comp.sys.atari.st
Date: 2005-03-06 11:27:39 UTC
From: videogamedude@gmail.com
Message-ID: <1110108459.165405.159200@o13g2000cwo.googlegroups.com>

Cross-posted to: comp.sys.atari.st,alt.atari-jaguar,alt.atari-jaguar.discussion

one of Atari's great mysteries is the XE-styled console prototype /
mock-up called MIRAI.

Mirai basicly means 'Future' in Japanese.

you know the NeoGeo....
SNK... The *Future* Is Now

hmmm, well....

Mirai had a HUGE cartridge slot, and, SNK's U.S. office was right next
to one of Atari's offices.

It is almost 100% certain that MIRAI was either:
a 16-bit Atari ST-based console. or a NEO*GEO-based console.
both possibilities make sense for many reasons.

please read these threads on the subject, and take in all of the info
& speculation.

http://www.tinyurl.com/5zjzf <-----if this url stops working, simply
browse to www.neo-geo.com > Forums > General Discussion and find the
Atari MIRAI thread

there is another one here:
http://assemblergames.com/forums/showthread.php?t=4028
(similar info, but obviously a different, seperate discussion)

Also, these 2 AtariAge.com forum threads (below) have a little info
and *alot* of speculation on the Atari Mirai console, including its
possible (likely?) connection to SNK-NeoGeo.

1.)
http://www.atariage.com/forums/viewtopic.php?t=43183&highlight=mirai
http://www.tinyurl.com/5pe7o (tinyurl ver)

2.)
http://www.atariage.com/forums/viewtopic.php?t=57561&postdays=0&posto...
http://www.tinyurl.com/5vbry (tinyurl ver)
(pages 3 & 4 are where Mirai is discussed)

up until this weekend, there was, from what I could find, basicly
nothing about Atari Mirai on usenet. there was like one post that
mentioned it. but no info. no questions. no speculation. no nothing.

so, I guess, concider this post to be the first real discussion on
Atari Mirai on usenet. (if there are other *usenet* threads, please

show me!)

finally, here are the 3 main web-articles speculating
on Mirai being an Atari-branded Neo*Geo

http://www.atarihq.com/museum/miscatari/mirai.html
http://www.atari7800.com/html/documents_articles_10.htm

Hi Edward!

>I got it to come up on my Hades under Magic.

So did I on my Falcon, running MagiC 6.20 and MagiCNet. I noticed that C:\GEMSYS is hard-coded in the program, which is _not_ good as my normal GEMSYS resides on E:, but a symlink took care of that :-)

>I have not found my location code yet so I used one for Tokyo.

I wasn't able to get to the weather.com site with highwire, but Cab did the trick. Select "world" from the topmost menu. Then enter your country (in my case: Germany) on the following page in order to get a list of available towns. Pick the town nearest to your location from that list, and copy the part with the "X" from the URL into the configuration window of zweather.

>Nothing came up so I guess I will try it under MintNet instead of
>MagicNet.

For me, it did work straight away under MagiCNet. Tried the pre-defined BEX... code first, and got the weather displayed, and my home location would work also.

With best regards
Ekkehard

I translated many of his programs into English, as Richard
doesn't speak the language well.

>The worse example was www.tosgroup.org, they wanted to define "news
>standards for TOS" but only in German, in their case, it was
>disrespectful towards the 'foreign coders'.
>[/Off Topic]

Again, I translated the first few TOS standards into English and
they added them to the German versions AFAIK. Unfortunately I
can't find them on my hard drive :-(

Regards, /Peter/

> So did I on my Falcon, running MagiC 6.20 and MagiCNet. I noticed that
> C:\GEMSYS is hard-coded in the program, which is _not_ good as my normal GEMSYS
> resides on E:, but a symlink took care of that :-)

No, it's not hard-coded, it is just the default LDG's path.

You can put the zview's codecs in any place, you need just to define the
LDGPATH in your system's environment. Or better, install the LDG's TSR.

With this one, the codecs become shareable (I mean that, for example, 2
softwares use the codecs but only one copy is in memory) and you can set
the LDG'path with the CPX provided.

http://ldg.org.free.fr/

>>I have not found my location code yet so I used one for Tokyo.

If you leave in US, it's even more easy.. enter only your zip code in
zweather and it will be able to find the wanted datas.

>>Nothing came up so I guess I will try it under MintNet instead of
>>MagicNet.

> For me, it did work straight away under MagiCNet. Tried the pre-defined BEX...

Hi everyone,

I thought it might be a fun and community strengthening thing to post
the statistics of the monthly traffic in this newsgroup.
I've just compiled a version of Catstat - originally by Timm Ganske
and adapted to the new Cat database format by Gerhard Stoll - where
you can choose the output language, presently either English or German.

What do you think, should I try to continue posting this at the end of
every month?

Cheers,
Mikael

From: Laust Brock-Nannestad <laustbn@diku.dk.invalid>
Message-ID: <d0hle1$91j$1@news.net.uni-c.dk>
Source record: 14515

Hi Atarians,

I don't suppose I could get someone here to send me fVDI or tell me
if it's available somewhere on the net? The website is down, and despite
heavy use of Google, I haven't been able to find any recent versions
elsewhere. I tried salvaging files off the archived version of
klockars.net over at web.archive.org, but frankly I'd rather have the
offical distribution archive :-)

My e-mail address is valid if you remove the ".invalid" at the end.

Any help is appreciated.

Regards,

Laust

You under advertise the fact that TOS 1.4 and up will boot from a 1.44 floppy and your board, with no messing about with step rate software you know...

Well its in the FAQ at the bottom of the page, there should be a article I wrote some years ago on the same page also.. I downscaled the pages some time ago as it was taking up too much of my time to keep updating a lot of pages, its probable its lost a few things also.... But in anycase ive been trying to drum it into people the facts for the past 8 years anyway, if ppl aint taken the hint by now then theres no hope ;-)

The 1.44 kits have been reduced in price to clear my stocks, I'm already selling the upgraded Atari's at a loss so can't afford to keep reducing prices on some things.. The mags and floppys are just getting in the way, like much other stuff, which is why im open to sensible offers and any of the stuff.

That is a good idea indeed.
I wonder if it would be possible to get a list of the Usenet readers
used?

AK>What does this mean?

It means that for example jerome.mathevet used two different mail addresses. In this case, the domain names "sdfsdfsdffree" and "asdasdadsfree" were used.

Cheers,
Mikael

Actually, it's just for a humble old 1040STFM.

I figure it will improve speed over the default VDI, if only slightly.
I could be wrong - I'm pretty "green" when it comes to the Atari 16 bit
line, but having a great time so far :)

Hello Mr Nice Guy, having a bad day? :/
Have you ever thought about the fact that your mail address is exposed
in every single message you write anyway? F.e. google groups lists the
mail address for every post. Or might you have considered the
possibility of bots using nntp?
So if I were to post this once a month it wouldn't make much of a
difference because all the addresses would already be out there.

Peace,
Mikael

Message-ID: <1110257559.429694.201920@l41g2000cwc.googlegroups.com>
Source record: 14531

Didier,

Well, I did read this section, but I was confused by a couple
things (perhaps a language barrier issue?)...

First, the parts that are connected to the U36 trace are 7404N
buffer (which I assume is the same as the 74F08 or 74F04) and an
inductor in series with a 100ohm resistor. These are all part of the
Nemesis installation. The 7404N is also connected to other locations on
the motherboard, such as the R216, R217, R221, and R222 resistors, and
the C147 capacitor. Should I remove the buffer completely, or leave it
attached to the components not mentioned by the CT60 instructions?

Second, the CT60 instructions mention first reconnecting the cut
trace from the SDMA buffer connection, then a couple of paragraphs
later it says to find that same trace and "tin it" before connecting a
47ohm resistor where the inductor and 100ohm resistor were. I assume by
"tin it", he means cut it again, but I'm not 100% sure. If that's the
case, should I really reconnect it before just cutting it again?

Finally, does the Nemesis board still work ok without the buffer
connected? I had an extremely stable system before, and don't want to
do anything that might jeopardize that, and really don't want to get
rid of the Nemesis, because even though the CT60 has a bus accelerator,
I really need the variable 16/20/25 MHz clocking that Nemesis offers
instead of a fixed clock, for various reasons.

Thanks for your help!

You know this is a good idea. The last place that did this saw the posts
increase dramatically. No one wants to see their name at the bottom of the
list or not on the list at all.

Hello guys,

Just a quick note to let you know my Atari Portfolio, smart parallel
interface and spare base for a portfolio are up for auction on eBay with
a low starting bid. Needs a new display cable, as indicated in the
auction, great for parts or an Atari dealer!

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&rd=1&item=5757729577&ssPageName=STRK:MESE:IT

Also up is my Epson SCSI Zip Drive which uses 100MB disks and works
perfectly with Atari machines. Link is here:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&rd=1&item=5172871131&ssPageName=STRK:MESE:IT

Thanks,
Mark

you should really consider trying to get Turbo-St.acc somewhere on the
net... I remember there'was a free version of similar tools by Darek
Miholka but I can't remember its name...
the difference is fantastic on a "humble" st...

Correctly configured, it can be significantly faster than even NVDI on a
Falcon+AB040, but from what I can remember from before I got the AB040,
it was mostly comparable (slower at some things, faster at other) to
NVDI even on a standard Falcon. I'm not sure I've ever tested it on a
1040, but it's certainly supposed to work there too, and I'd expect
the speed differences to remain similar.
The default VDI is left _far_ behind.

Note, however, that I was never interested in the standard Atari
colour modes, so support for those is nearly non-existent in the
current fVDI drivers. It would be relatively simple to use the code from
EmuTOS to make a 4/16 colour fVDI driver, but then you would of course
not get much better speed than standard TOS on many things.

In short, if what you're interested in is monochrome, then fVDI should
provide an immense speedup over the standard VDI. As well as support
for GDOS fonts, Bezier curves, etc. It might be usable in 4 and/or
16 colours too but, if so, with severe limitations.
I'm somewhat unsure about the level of support there was for the old
monochrome mode (it's been many years since I last used that for
anything besides running MonTT on while debugging fVDI/RageII), but I
think most things should be OK. Possibly there are only non-patterned
lines (unless you turn off line acceleration, which you really don't
want to do ;-), and the mouse pointer might not clip horizontally...

Regarding availability, I think my cvs server (public read access)
should be up and running (email me for information on how to access it,
if anyone is interested), but that only has the sources.
It's been quite a while since I last had my domain pointed to my own
computer, but it looks like I'll finally get a little more free time
starting next week so there is some chance of a working web site within
the not so distant future. In the mean time, send me an email at
johan@klockars.net and I'll try to dig up the relevant files and send
them over.

As always, any and all questions, comments, etc about fVDI are very welcome. I know it's been a long time since I did anything much about fVDI (or anything else for that matter, but I did get fVDI to compile under gcc not so long ago ;-), but I still care and will eventually get back to it (and MGIF now that the GIF patents are out of the way).

I'm kind of __far__ behind on all email right now, so if you don't hear from me quickly, it's probably best to try again. Your letter was likely lost among thousands of others.

Hallo Edward!

ESBJ>You mean you actually got numbers and everything?

Yes. That's what I refer to as "working" :-)

ESBJ>I got nothing. I wonder why this is so? I have an EtherNet
ESBJ>connection through a router, so in theory it should work.

Well, I've got a dialup connection with PPPD. Could this be a DNS problem of
some kind?

Hey Mike! It may not be much help to you, but my CT60 is running fine
on top of my Nemisis.

AK>So this is wrong, becouse atari@gabo.pl is my email but I do not own
AK>atari@aracnet.com or atari@NOSPAMbtconnect.com.

Oh, well, this must be because the program was originally written for
the german mausnet. Come to think of it, it wouldn't work there
either I guess, since different people sometimes do have the same
name.
However, it's possible not to include this dupe check, so I won't in
the future.

Come to think of it, my database stretches back into november, so
here are the december 2004 stats. Be calm, I can't make more stat
posts now, so you can relax until the beginning of next month ;)

Cheers,
Mikael

Thanks alot Edward!!! That means alot coming from an atarian such as
you. Believe it or not this is my first web page I have ever put
together. Its actually FUN putting something like this together and
with my PowerMac G4 its just plain simple to do and did I mention its
alot of fun??? Yeah I guess I did have a picture up there of me. Not
the greatest looking in that pic since I was outside raking up the
leaves with my son on our lawn tractor. LOL!!! Yeah I may have to give
you a call on that one. I am not sure what exactly is going on with it.
I have it recieving messages without any issues but sending them is a

tricky thing. Either I dont have something setup quite right or I am just not doing the whole sending of the messages in the proper way. I will give you a call sometime.

Thanks and keep up the atari fight!!! I know I am!! Did I mention that I am getting one of those 100 mhz 68060 CPU's for my CT60??

Thanks,
Carey Christenson

> on top of my Nemisis.

Did you remove the SDMA buffer modification, as recommended by R. Czuba
and others? As long as I can be sure it will work without this buffer
(which, according to the Nemesis documentation, is necessary for system
stability), I will give that a try. I just want definite confirmation
before I start hacking away on otherwise stable hardware.

Hi Jean-Luc!

JL>etc_path i:\etc in mine. Tried activating link2u after having added
JL>the line sln i:\etc u:\etc, but still no success :-(

That's not necessary, as MagiCNet takes care of the etc link itself.

JL>Er... what the hell do those variables have to do with it ? Is this
JL>MagiC! or MiNT ? Always thought it wasn't necessary with MagiC!...

This is MagiC. BUT... we are trying to run MiNT programs on top of it, and
that's why we've got to add as much of MiNT's functions as possible. I've been
able to run wget and cvs with MagiCNet also, so the compatibility can't be that
bad.
U:\HOME is a "must have", and so is U:\TMP, of couse the above mentioned U:\ETC
and U:\USR\local\samba if samba is to be used.

I tend to having _a_ _lot_ of drive letters, so I had to switch off LFNs on
drive U: in order to provide enough space for all those symlinks in the static
directory space for U:\.

With best regards
Ekkehard

776. ST book seen at eBay

Newsgroup: comp.sys.atari.st

Upon browsing through eBay (United Kingdom) I found an Atari ST book:

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&category=96944&item=5172880946&rd=1

It's starting at UKP 1500, so definitely nothing within my price range,
but perhaps someone else. Thought I'd mention it here in any case since
I know that several people have been looking for one.

I've put a command into my script that runs Cat-Stat to automatically
remove the line containing your mail address. Do you think it's a
reasonable compromise? People using NOARCHIVE, who don't want to leave
any traces whatsoever, can send me a message stating they do not want
their mail address in the list, and I'll do the same for them.
Otherwise I'd have to scrap the whole thing, which feels kind of sad.

Cheers,
Mikael

Sorry but i think it should be you specificaly seekeing permission to
publish people's email address, its also illegal in some parts of the world
to do so under privacy, ant-spam and data protection laws.

What you have posted already is most likely benig digested in some spam-bot
or virus writers database.

> Otherwise I'd have to scrap the whole thing, which feels kind of sad.

I do no want my email address published without my explicit permission and
I'm not chasing you to give it.

Why not display the user name rather than the reply-to details?

so 1. Egon@the.lab 20 5.5 491 3.9

becomes

1. "Egon Spengler" 20 5.5 491 3.9

Would that not quell the email address concerns?

Egon

Well, I checked the cache settings, and the cache is turned on.
However, when I tested it as mentioned before, I was booting into a
completely clean system (i.e. holding down Control while booting). If
the CPX is necessary for the cache to be turned on, even if it had been
turned on before, that might be the problem. I will test that. Also,
I'm still running at the stock 50MHz that the CT60 came with. I haven't
tried any faster clocks. I thought I'd do that after I had the thing
running well. But, if a faster clock makes it crash less, I might give
that a try, too.

Well, older Nemesis boards ran at 20 and 24MHz (40 and 48MHz crystals),
and newer ones ran at 20 and 25MHz (40 and 50MHz crystals). I have the
faster version. It can also be turned off for standard 16/32MHz
operation.

> What kind of STram board are you using?? It has been said that you
need

I *think* it's a RAM Karte by WB Systemtechnik. I bought the computer
second-hand, and it came with documentation for that, anyway. It looks
like a blue-colored rectangle, with the memory hidden underneath, if
that makes any difference. Any more than that, I'm not sure.

> > 4. So I took the jumper off and tried with the CT60 on again, and

As a side note, I did finally get it to boot into 030 mode with the
hard drive being accessed, and I was able to change the settings and
get it working again. The problem seems to be the Blitter setting. Fast
works fine, Slow crashes the system on boot-up, as described above.

> Does the Hard drive sound like it wants to boot at all?? Does the

get
> sorted out what is going on.

Like I said, it is now accessing the hard drive and floppy drives fine. It could always access the floppy drive without problems. I'm pretty much convinced it's the Nemesis installation that the CT60 isn't happy with - specifically the SDMA buffer Nemesis came with. If I can get confirmation that everything, including the Nemesis board will still operate without this buffer, I'll just remove it.

Thanks for your help!

Slightly beside the point, but wouldn't this kind of salutation also no=
t
be tolerated, since it reveals the mail address? Not by people not
having X-NO-ARCHIVE in the header anyway .. But since we are being
strict here .. ;)

SS>> Why not display the user name rather than the reply-to details?
SS>> Would that not quell the email address concerns?

SS>I see no reason for my objecting to that.

For me it would be to much of a hassle to rewrite Cat-Stat to output
the christian name and the surname instead of the mail address.
Complicated stuff, the Cat database. Even if I would do this, some
people don't enter user name information. And I'm pretty sure now some
people might object to the real name being posted in a message (which
would complicate normal replying in messages, but hey).

For these reasons, I will not make any more stats posts. Sorry about
this.

Cheers,
Mikael

NTSC is the North American standard, just like PAL is the standard in
Europe.

I guess the original poster just wanted to make sure he wouldn't wind up
with a TOS version that wasn't suitable for where he lived. :-)

Thanks for the info. As far as I can tell, fVDI won't be as much use
to me as one of the older screen accelerators mentioned by a previous
poster in this thread, especially since my Atari currently runs in
medium resolution (until such a time I get/create a proper mono
cable)

790. Sony MPF920 modified for ST

Newsgroup: comp.sys.atari.st
Date: 2005-03-09 23:11:33 UTC
From: Bill Freeman <flipflapcospamblock@yahoo.com>
Message-ID: <0903200051811331875%flipflapcospamblock@yahoo.com>
Source record: 14467

I bought 4 new MPF920 Sony drives from NewEgg and they arrived today.
Now I need a little more advice from someone who has done this.

1. Disk Detect

There is a switch by, and mechanically liked to, the eject button
button labeled "SW3". Is that what you bridge for "disk detect"?

2. Drive Select

Just inboard of pins 10 and 16 of the cable connector there are two
pairs of solder pads labelled JC30 and JC31. Next to JC30 it says SEL
0. Next to JC31 it says SEL 1. Across JC31 is soldered a very small
rectangular bit with what appears under magnification to be a zero
printed on it. Is this the jumper? Is it just a jumper, or is it a
discrete component that I have to unsolder from JC31 and move to JC30?
This "jumper" is 2mm long and less than 1mm wide. I hope I can move
this thing without destroying it or the board. If they figure out how
to make this stuff any smaller you will need a microscope to see it.

That's a rip-off. Typical Gasteiner, they were always hidiously
expensive.

Hey Mike, this is Wayne. I have done nothing to my Nemisis. I think I'd
be a bit slow to do anything to it. Then again, my Nemisis is the older
1 that does 20-24 mhz.

You have to have a good ram board. I've had good luck with a
Wizztronics RAM board. Seems to me I saw somebody talking about makeing
a run of goos ram boards in Europe somewhere.

It is a zero ohm resistor, otherwise known as a jumper, if it breaks you can use a piece of wire or provided there's not a PCB track running between the bridge a large solder blob ..

Source record: 14472

Hi, Lyndon!

LA> Doesn't mention much about it, condition etc. And since when did they
LA> have CDROM drives?

Yes, you're right. STBooks do not come with these features that are
promised in the announcement:

- "Resolution:" ... "320*200 16 colours"
- "Colours:512"
- "Interfaces:" "2*Joystick, Monitor, ROM-Port"
- "Storage:Disk (eingeb. 3.5" 720KB)" ... "CD-ROM"

The statement about installed RAM is not clear as well:

- "RAM:1 (4 MB) MB"

I'd say that the seller has no idea about what he is offering, he probably
never has switched on the STBook... The description seems to be cut&paste
from some web pages...

Regards,

Alexander

Looks like it.
Let's see if anyone actually bids above the ï¿½ 1500 starting bid. I doubt
it, unless someone has a problem getting rid of cash and is an Atari
enthusiast ;-)
I have a feeling we'll see the same machine showing up once again, with
a lower starting bid.

an ST-book would be nice to have (especially for MIDI related live
gigs), but for 1500 British Pounds I'd buy a current Macintosh Powerbook
or iBook, and they *do* have CD-ROM drives built in ;-)

Yeah its hard to say as to whether or not the CPX needs to be installed
to turn on the caches. Not sure on that one. But I would hazard to
guess that it is. I am not saying that the 72 mhz made my system more
stable but it sure is odd when I changed the oscillator out to the 72
mhz it began to run even more stable. I am not sure how much higher you
will be able to go with a 50 mhz. clocked CT60. I have 64 mhz
oscillators so if you need some, hold tight I have a project that Mark
D. is doing for me and if I have an extra oscillator your welcomed to it.

I read about a guy in Europe somewhere that was supposed to be producing
16 mb cards for the Falcon that were approved by Rodolphe for use with
the CT60. Anyone know where this can be found????

I never messed with that setting. Blitter does need to be set to FAST
and NVDI I believe is recommended for use on the CT60 to improve
stability as well.

No problem, I am not sure that the Nemesis is the issue though. It
could be a software issue AND the AUTO folder order this is a BIG key
also. Make sure you have MAGIC.PRG at the beginning of the stack and
then CT60xbios and DSPxbios and Except060 programs next then after that
I would go with your NVDI then CD-rom driver software and internet
drivers and anything else after that. This makes a BIG difference in
how the system will act. There is always better ways to organize your
auto folder so you get the best stability and speed from it.

To everyone,
Just to let everyone know. I plan this weekend working on my CAB HOTLIST and removing and adding web pages to bring it up to date. Unfortnately some links dont work anymore and should be taken off. And I have some that are on my MAC that I hope to add to the list. I also plan on doing some other changes as well. So HOLD TIGHT and there will be a major update very soon. Just a few side notes. If anyone has a link to an atari page and would like to see it added into my CAB HOTLIST or even on my FRONT PAGE let me know. If you want a link as a graphic you must supply the GIF or JPG. Also, if anyone has some cool ideas for improvements to my web-page I am more than happy to read any e-mails or messages on CSAST. Also, does anyone have a cool GRAPHIC they could suggest for my FALCON060 Homepage title at the top of my web page?? Also anyone know what happened to Magic Online??? The URL to my web page is as follows:

http://users.adelphia.net/~falcon060

Thanks,
Carey Christenson

P.S. E-mail me via the contact at the bottom of my web page. Thanks!!

You cannot to the best of my knowledge connect an IDE HD to the Atari
parallel port -- there are simply not enough of the correct lines.

An IDE adapter for the Atari exists (or at least used to), and an ACARD
IDE/SCSI bridge along with an ASCI/SCSI adapter should work as well,
although I don't have any knowledge of anyone actually doing it. I'd
suggest looking for the IDE adapter.

Galen

Just to solicit a few comments since we appear to be on the topic:

1) My CT60 runs fine with <CTRL><LSHIFT> held down at boot. I'm really not sure just what those keys do, but if I don't do it it's bomb city. Does anyone have a clear idea about what I'm sacrificing by using this boot mode?

2) Every few weeks the CT60 refuses to run, although the computer runs fine in 030 mode. Opening the case and jiggling the CT6- a bit causes it to run again. Any ideas why? I'm suspecting bad solders on the expansion port, but that's just a guess.

3) How fast do you have to boost the Videl to get 800x600x256 at at least 60 Hz? I'd love to have a SuperVidel or to be able to get my NOVA running, but I don't know when (if ever) that will be possible.

Galen

You shouldn't have resisted the temptation to do a little research first, then. Everything Ben needs to satisfy his customers has been out of production for at least 8 years, possibly longer. He provides support to people running vintage systems; support that's very hard to find at *any* price, and Ben isn't getting rich by any stretch of the imagination.

You're attacking a guy who does what he does for the lowest practical price because he passionately believes in supporting the people who need his support. If there were more people like Ben in America today, we'd be a Hell of a lot better off.

We can probably do without the "shoot off mouth, check facts never" types that attack him here, though. Ever thought about emigrating?

From: Mark D <mducksub@notspamatari-source.com>
Message-ID: <pan.2005.03.11.10.43.14.113145@notspamatari-source.com>
Source record: 14495

Hey everyone,

A small step, I got vnc working using the GEM x server and using the XGetImg call. Kind of a proof of concept, shows that things are pretty slow, even on my 80MHz 060... slow or not it's useable though and quite interesting to display my falcon on my linux box. I'm sure once I'm polling memory natively or using vdi (hopefully it's possible) things should be MUCH faster. I also have to figure out how to inject keyboard and mouse input.. THAT I don't think will be too hard.

Anyway, without further ado.. Here's the neat stuff :)

http://www.atari-source.org/atari_vnc.png

Thanks,
Mark

Source record: 14497

1) from the CT60 documentation:
11.3 TOS Keyboard shortcuts CT60

CTRL: Boot without AUTO folder and ACC.
ALT: Remove cache if pressed before the SDRAM init.
Boot without disk if pressed after.
CTRL-SHIFL: Boot without PMMU tree like a 68060 EC if pressed before
the Atari logo.
SHIFTL-SHIFTR: Boot without SDRAM if pressed before the Atari logo.
SHIFTL: Displays infos about the SDRAM module.
CTRL-ALT-UNDO: NVM and Flash Parameters init if pressed during the
memory
test until the Reset. You need to set the delay at boot
to
60 seconds with the configuration CPX.
CTRL-ALT-
SHIFTL-SHIFTR: Start the Atari Diagnostics if pressed before the Atari
logo.

2) My CT60 seems to be prone to movement on the internal bus. I have had to open the case and re-seat the CT60. This I think was due to the quite thick PSU cable plugged into the back of the CT60, the socket is quite a way from the BUS connector, so the CT60 can 'pivot' slightly on the pins. Since I moved the PSU inside the case, I have had no trouble. You could try putting a couple of _small_ dabs of hot-glue on the ends of each bus connector once pressed down. This will be enough to keep it seated and still be a breeze to remove when you need to.

3) My videl's external clock is 40 and the internal 32mhz clock is now 50mhz due to the CT60's clocks booster. I can get 800x600x256 with either. I havent played with the screen for a while, since changing the clocks so I cant be sure if I am now getting 60hz or not, but I am almost sure that I did with a 40mhz clock.

Coda.

Great suff :)

Yoy'll need to hook to VDI vectors so it could work on any machine.
Maybe try asking Ozk so he could provide some 'legal' way to do it in OVdi?

On a Sony MPF920 floppy drive, there is a switch next to, and
mechanically liked to, the eject button labeled "SW3".

Is that what needs to be bridged for "disk detect" to work properly on
an ST?

This information is not is not contained in
ftp://gem.win.co.nz/hall/hardware/sony_144.zip
If it is, I don't see it there.

The PMMU is not used. If you have crash with the PMMU, I think than you
have an old 060 rev 1 and also cache problems => try with a lower
frequency.

I don't know the Nemesis, but you need to obtain a Falcon like it was
inside Atari factory ;-)

> Second, the CT60 instructions mention first reconnecting the cut
> trace from the SDMA buffer connection, then a couple of paragraphs

> case, should I really reconnect it before just cutting it again?

No you need the trace like the arigianl falcon, just add 47 ohms on the
SDMA buffer between the clock pin and the ground. It's the Rodolphe SDMA
clock patch.

> Finally, does the Nemesis board still work ok without the buffer

I know than the CT60 not like delay created by external buffer on the
motherboard, so for me you need to remove all buffer(s).

Sorry, I offended you. It was meant as a tongue in cheek post i.e. in
humour. I never implied that Ben was getting rich nor was I implying
that the stuff he was seeking was still in production. It was a quip
at his "no dealers" statement!

>
> You're attacking a guy who does what he does for the lowest practical price

I guess that's a matter of perspective. I think the newsgroups would
get a lot less use if there were more people like Ben. That's just one
man's opinion.

>
> We can probably do without the "shoot off mouth, check facts never" types
> that attack him here, though. Ever thought about emigrating?

Emmigrating? Huh?

I don't understand that last statement. Perhaps, I should do some more
fact checking.

> Anywho, what I'd like to know is have any of you used it? Is it
> compatible with SpeedoGDOS and/or NVDI?

There was a special disk which the guy behind Atari World put together which allowed Timeworks ST2 to run with SpeedoGDOS. I bought it, played around with it and got it working to a degree. Usual problem was that after printing a page or set of pages it would crash with a couple of bombs and you needed a reboot to carry on. In the end I used a combination of non SpeedoGDOS Timeworks and Calamus 1.09 to do a magazine rather than put up with the hassle.

Eventually I progressed onto Papyrus and the results of my time with that program are well illustrated in Atari Computing magazine, as in the fact that nearly the whole of the issues from 7 onwards were done with Papyrus. Considering it was a WP program rather than a DTP program, it was pretty easy to do quite complex layouts. I even found a way which was never documented on altering the flow of master page elements, and I know one of the people behind at ROM was surprised at what I had been able to do with their program. They never, unfortunately, ever sent us a later version of the program so I stuck with version 5 IIRC!

Print output from NVDI coupled to a 600dpi Laserjet 4 was superb and as we provided camera ready copy for our printers, it had to be good, The quality of the halftones was very very good and the printers reckoned it was best CRC they had seen, and much better than the PC program output which we used for the first few issues.

Oh happy days!

GEM-based Atari ST software runs under MagicMac. One need not have a
68000-based Macintosh as the emulation is excellent.

Galen (who finds that a 603 based laptop runs MagicMac much better than
his 68030 did)

Hi all,

Even though ive got all the collection of ST format mags, one has to wonder about keeping the coverdisks. Probably in 5years+ times they aint going to work anyways.....

though I can imagine in 50 years time when I goto the antiques roadshow they will say "well the mags would have been worth a lot more if you had the origional coverdisks"

Since I have collected pretty much all of them, its a shame to chuck them, but not much use in keeping them right ?

No, that is not what a STacey is worth. An Atari STacy is worth
£200-£300 tops in mint condition. You must remember this machine is
acient technology now. It's of little use to anybody except the
hardcore Atari collectors.

£1500 for an ST Book is a pisstake. Yes, they are rarer than STaceys
but they certainly aren't worth that much. You can buy a top range
laptop and install Aranym for that price.

I don't think the disks have much financial value - nor the mags. They were
too mass produced.
Once everyone throws them out though, the ones that remain will become rare
and perhaps valuable one day. Condition is important though and people will
look for ones still attached to the mag.

For now it is more important to preserve the software that is important to
you. Make backups of the stuff you like.

> If it is, I don't see it there.

It's been a while since I worked with this and I can't remember all the details, but looking at the "sony_144.gif" or "sony_144.img" illustration jogs my memory.
On the right hand side you'll see that part of the circuit board where the switches are. This is the circuit board seen from underneath the drive, with the eject button/disk-insert side on top.

From the left hand side the first switch (WRPT) is the write-protect switch. Then there's the disk-detect switch (CTIN) which should be shorted. Finally, on the right hand side you have the HD/DD detect switch (HDIN). Compare the switches with a high-density floppy disk and you'll easily see where the write-protect and the HD/DD switches go.

This is for the Sony MPF 520-1, but I can't imagine other drives being very different.
The drive will work fine without shorting/bridging the disk-detect switch, but like I experienced with some test-disks of mine, you can end up with the computer not "knowing" that a floppy disk has been removed, and another one inserted.
Be sure to try it all out with different floppies that are *copies* unless you really want to lose your valuable data ;-)

Again, I can't remember the exact details here, but I think that I verified the fact that the computer didn't recognize a disk-change by seeing what happened when I pressed the ESC key to re-read the current disk content after a disk-change. I believe that I exchanged a disk with another one, pressed ESC, but the drive *didn't* re-read the disk as it should, simply because the computer wasn't told that a new disk had been inserted. So if this happens you could very well get some seriously messed up floppies. Try it with some test disks.
Shorting the "CTIN" (disk detect) switch solved this problem as it re-reads the current floppy disk every time ESC is pressed.

Correct me if this doesn't make sense, someone; this is all from memory.

This is the LAST request to some people who reserved before the february 25th and never gave sign of life after...

You have to confirm your reservation for CTCM &/or CT63 &/or 060 rev.6 NOW ! For that, please send me email and pay.

In a few days I will order 060 rev.6 and Production of CTCM at a number matchning the nurmber of orders I received...

It will be IMPOSSIBLE after for you to get one of these products !!!

LAST EMAIL...

If I have no sign of life from you in the 3-4 next days...I will remove you from the list and do not count you for the manufacturing of CTCM and/or 060 supply.

If you decided to not order and have reserved something, PLEASE, INFORM ME !

THANK YOU

I think the point was that their *English* web site (for all system versions, not just Atari), hasn't been updated for a *long* time, even on the papyrus.de domain. If they have an English version of Papyrus X (which I've heard they do), you wouldn't know it from their site.

I'm hesitant to use the one in the CT60, because I prefer the Nemesis' variable one to a fixed one, and I also need it active in 030 mode, which I've heard the CT60's is not usable in that mode. The reason I would like to get the Nemesis' variable clock speeds up and running on it, is that because of the age of my monitor (I have an old Mitsubishi multisync monitor that can sync down into the RGB ranges), it has difficulty with certain ranges of frequencies. With a 20MHz clock on the Videl chip, the frequency ranges are perfect for just about any 4:3 ratio mode I need (800x608 non-interlaced at ~65 to 70Hz, and 1024x768 or higher interlaced). But with the 25MHz clock, if I get a vertical frequency that works, the horizontal frequency is out of my monitor's capabilities and all sorts of wierd things happen. Same thing if I get a good horizontal frequency. But, if I want to play certain games in 030 mode, such as one of the Reservoir Gods' NES/GB emulators, I need all the speed I can squeeze out of the thing.

> how the system will act. There is always better ways to organize
your
> auto folder so you get the best stability and speed from it.

Well, I've placed the AUTO folder in exactly the suggested order that Rodolphe and you suggest to begin with, so that's not the issue. Also, I've tried with as clean a system as possible: MAGXBOOT, the three CT60 programs, NVDI, and the Nemesis drivers (in that order), and I get the same results.

That said, I did discover something. Nemesis uses two driver programs. One is the base driver (I assume) called NEMESIS.PRG, and the other is one of the switching programs to activate the new clock speed

(NEM_LO.PRG for 20MHz, or NEM_HI.PRG for 25MHz). If I have just the NEMESIS.PRG driver in the AUTO folder, I can activate the clock switching programs manually from the desktop now, or from Magic's START folder (which I couldn't before, and don't know what I'm doing differently now). But I cannot put them both in the AUTO folder like you're supposed to, or they'll crash the system. So at least I have an ok workaround for that. However, I have a new issue. Even though I can activate Nemesis now, I can't get Videlity to run properly, which is the program I use to increase the resolution size. After the system is booted, the screen resolution does change to match what I want, but I instantly get an Exception Fault error and a bunch of details and the system completely freezes. I have discovered that it's mostly a problem with an ACC or CPX, as this problem seems to not happen if I disable my ACC folder. I haven't had time to find the exact problem ACC/CPX yet, though.

HRTC.PRG (the program that came with Nemesis that only changes the 320x480 TC resolution into 640x480) does work fine, however.

Except for this new problem, I actually am now in a much better situation than before. I can at least get my system up and running well (and FAST!), with most things working as they should. I just can't get any higher than 640x480, which is a bummer, as I've gotten used to nice high resolutions, and now I'm feeling a bit claustrophobic working in this cramped resolution, not to mention it doesn't look as nice. Hopefully, I'll be able to track down the exact problem that is giving the system fits when Videlity is running, and have my system completely back in working order.

Thanks for everyone's help!

It does make sense.

TOS doesn't use the hardware change-line signal that PC drives have.
Instead it polls the drives at the VBL checking if the write protect
signal changed. The idea is that (hopefully) the VBL will detect the
forced changes *while* you are inserting/removing the disk.

The above procedure works fine (more or less) with Atari drives. But if
the drive uses the change-line protocol, it will fail. So you must disable
it, older PC drives had a jumper, newer ones are of course, jumper-less.

I wouldn't have thought the mags are rare enough to bother scanning them all
in. There are plenty around, though people keep chucking them out. It's hard
enough finding someone to take an ST off your hands !

Have you tried adding this setting in magx.inf:

; #_TSL <non pre-emptive>

And then setting pre-emptive multitasking back on with the timeslice cpx?

The purpose of this is to turn pre-emptive m/tasking off whilst your
auto progs load. That allows each one to run to completion before the
next starts, which can help with problems such as yours.

Once its all done, the cpx switches pre-emptive on (save the setting so
it's all carried out automatically).

$530 for plain 4MB on eBay right now.

> CT60/63?

200 EUR for CT63. For the better first run CT60 falcon, fully setup and
modified with good ST-ram card, and rev6 060, it will be over $1000USD
soon for sure as it's better than the similar expensive hades or Milan.

Prices are skyrocketing for Atari stuff.. Even ST's.

Thanks,
Mark

Hi,

You can find in my webpage zweather 1.0

What's news?

- STing compatibility layer has been added.
- A very bad bug was present in the "icon" code. it caused memory leak (
shame on me).
- Zweather works now on old 8+3 partition.
- Many others littles things.

If I have the time and the motivation, the next step will be a
"radar/satelitte" view of the wanted city and a French/German translation.

Ciao,

Message-ID: <jd8b31pt7kjm3bj9rqurg48hdkdk5r2p3a@4ax.com>
Source record: 14368

I just finished looking at a 540ST, in order to do a little
hardware project involving the YM2149 sound chip. Information on the
chip was easy to find on the web; I managed to obtain a schematic for
the ST, and the Yamaha datasheet for the 2149. After examining the
write cycle timing with the ST in, I guess it could be called
"keyboard not found error" mode (continuous tones emitted), it seems
that the access and hold times are significantly shorter than those
printed in the datasheet (measured: access time 180ns, hold time 50ns)
Does anyone know if the chip actually used in the ST, with the "F"
suffix, is supposed to mean something like "Fast"? The datasheet
doesn't mention any suffix designations. Did I make a mistake with my
measurements somewhere? I saw some references with google that seemed
to imply that there were both chips with no suffix, and and F suffix,
(and a C suffix?) but there was nothing I could see that stated what
the differences are.

893. Getting a new (silent) SCSI hard drive/partition sizes

Newsgroup: comp.sys.atari.st
Date: 2005-03-14 23:51:52 UTC
From: Hallvard Tangeraas <inv@lid.email>
Message-ID: <4236233d$1@news.broadpark.no>
Source record: 14370

It's been a while so it's slipped my mind....
how large can hard drive partitions be under TOS 2.06?
Isn't there a limit to how big the actual drive can be as well, or is it
just a matter of not being able to use all the storage space of a big drive?

Secondly, is it possible to buy "small" (by today's standards) SCSI hard
drives these days? I've done fine with a 540 Mbyte drive for years, so I
suppose somewhere between that and 1 GB would be more than enough.
And most importantly: the drive has to be *very* quiet -actually close
to completely silent if possible. Any drives which can be recommended?

I'll be using the Link 97 along with HDdriver.

I would go to all the PC Recycle stores you can. I just picked up some SCSI HD's. A 1GB Slim Seagate and a Quantum 1.2GB for, get this, $2 each! Work great too! Also got two Zip 100 SCSI drives for $5 ea. Also got some Epson SMD-300 drives for my Mega STE/TT030/Falcon030. ;)

With your Link97 there is no size limit for the drive.

> And most importantly: the drive has to be *very* quiet -actually close
> to completely silent if possible. Any drives which can be recommended?

If a silent drive is very important for you consider adding an IDE
interface to your Atari and then using a CF card as your drive. This may
also work for SCSI, but I don't know the price for SCSI CF adapters.
Note, however, that CF cards are usually slower than real hard drives.

Source record: 14375

After all the years I want to reassemble my PAMsNet. Everything works fine, but I can't get my E-DMA-Adaptor working because the original Driverdisk cannot be read anymore (yes, no backup...)

Has someone got that driverdisk and would mail it to me? Even single files (e.g. NETH.PRG or the TCPIP files) would be useful. I have got the original disks and licences, but PAM Software is out of business for years...

Thanks

Jochen

HI all,

trying to put together a page of LSD menus, I have about 20 of the menus on floppy which I will image latter, I only found the odd few dotted around the net, anyone have any of these for swaps ? I will make a list of the ones I have when I get chance,

cheers,
chris

So I only need to watch the partition sizes in order to take full
advantage of the available storage space, such as creating at least 4
partitions of 512 Mbytes with a 2 GB drive?
Is there a limit to how many partitions I can have?

>> And most importantly: the drive has to be *very* quiet -actually close

Interesting. I wasn't aware that there were IDE interfaces available for
those cards.
About the speed: will this be noticable on an Atari STe (or Mega STe)
and cause a lot of frustration and problems?
Or are you just referring to today's PCs and Macs?

14 with TOS, but with HDDRIVER you can also use A: and B: for your hard
disk drive, which results in 16 partitions.

> Interesting. I wasn't aware that there were IDE interfaces available for
> those cards.

Actually the CF cards have an interface that is not much different from
an IDE port.

> About the speed: will this be noticable on an Atari STe (or Mega STe)

> Or are you just referring to today's PCs and Macs?

With an ST/STE there is probably no great difference between a hard disk
drive and a CF card. If I remember correctly with my Falcon the data
transfer rate when reading from a CF card was about 1 MB/s. Writing is
slower, though. But definitely silent :-).

I'm going to be attempting to sell off a bunch of Atari ST software (mostly games, but some other stuff, too), and all my starting prices will be $3 per bundle. I hope to have a couple huge lots (like a bunch of Psygnosis stuff for one), and a few heavy ones. ^_^;;; But in any case, all will have original disks and most have complete instructions and documentation, and even the box they came in. Look for seller "obscurestuff" and yes, I will ship internationally. So far, I have 2 lots up on eBay. Sorry if this is inconvenient for some, but perhaps if there's interest, I might post here for any unsold lots.

I hope no one minds this little blurb.

Sounds like a good solution.
How much storage space does it have, and how much did it cost?

If DMA is used, it may reveal a SDMA clock problem !
Especially if the mb is boosted...
Check about SCSI transfers and audio...

SDMA is managing both three functions.

Guys,

There are different speeds of CF card. It is usual to see CF cards advertised as 12x, 40x, 66x etc. I would be interested to see where the bottleneck is as far as transfer rate is concerned, and what difference each speed of card makes to tx rate.

Coda.

I did some googling and found out that KODAK produces a CF SCSI-2
card reader for digital photo systems. It is specifically stated that
it implements the ADTRON hardware.

I am now off to the big shopping mall called 'Amsterdam' :-)

Well, If you do a simple google "scsi card reader" it appears that
there are more manufacturers. Majority is indeed digital photo realm.

PAMs E-DMA is an external Ethernet Adaptor which plugs into the
ASCI-Port of 1040/Mega/TT. I successfully could get it to work with
Mintnet, but I also want to integrate it into my Pamsnet. (Pamsnet is
a Network software from PAM, Germany, which was delivered as a bundle
with PAM VME, E-DMA, E-Mega and Flexlink - no native TCP/IP). I have a
Pamsnet running, but unfortunately my original disk for the E-DMA Node
is unreadable after all the years...

Source record: 14394

Maybe I can offer some additional comment on Atari ST formatted 720K discs and PCs...

I have a Toshiba 440CDX laptop with an external floppy drive - and the thing with this is that the external drive reads and writes to Atari ST formatted 720K disks.

However, those same discs do not read at all in Windows Desktops. I haven't tried a friend's Win98 SE system, but I do know 2 XP systems that couldn't read them at all.

I am fortunate that I had a laptop and its external floppy drive to access my ST formatted discs since the ST I was using had to go back to its owner when we moved (otherwise I had been using it for some time).

Not all Windows systems read ST discs. I should point out the Toshiba laptop has Windoze 95 on it. It could be the drive, it could be the version of MS DOS, or the version of Windows, that presents the problem.

The older the system and OS and all, likely the better the chances the system will read your disks. I have not had the chance to test any HD ST disks. T.T

You've probably already thought of this but bad media? Dirty drive? Bad
drive? Bad cable?

1 copy out of 6 sure seems pretty random doesn't it? :-(

921. HighWire 0.2.5 Released

Newsgroup: comp.sys.atari.st
Date: 2005-03-16 17:34:22 UTC
From: Dan A <artdeptNOSPAM@coinboards.com>
Message-ID: <y6_Zd.6251$qf2.4665@newsread2.news.atl.earthlink.net>
Source record: 14398

Stop the worries, stop the fears, a new version of HighWire is now here.
Or in other words HighWire 0.2.5 is now available to the public.

All of those long winter evenings weren't wasted. Quite a number of
improvements have been made to the program. Among those are...

* CSS parser improved for better compatibility
New Keywords implemented
o height
o float
o clear
o border
o font
o min-width
o size values enabled for tables

* Rendering improved for floating block elements (eg. DIV, TABLE, P ...)
* NOWRAP bugfix
* Several improvements for Table layout
* Link Handling reworked and improved
* Colour logo added for start window and icons as well as a seperate RSC
file for the desktop
* A few continous loop lockup bugs eliminated
* better handling of Script and Style tags
* Plus Several more (but less obvious) bugs fixed.

What does this all mean. Well you can expect many sites to look quite a bit
better.
The program itself is less succeptible to poorly written html locking it up
and at least a few of the annoying bugs with link, script and style tags are
now gone. We think you will find it worth the wait.

well over the last week ive copied over 1,400 floppies with no problems,
some of them were of course faulty, though as soon as I go into CT60 mode,
afew floppies latter and the thing crashes..... go back to 030 mode, try
same floppy and im away again.... ive already downclocked the CT60 to 50mhz,
which solved a lot of problems, though it seems its more of a patch software
kind problem to me, works fine until it gets a floppy error then crashes, so
forced to use 030 mode, which is no fun on a unboosted machine at the best
of times :-(

Best Electronics & B & C ComputerVisions in CA has them, NOS for a
reasonable price. I got one for a 1040STE and a TT030 and it also made my
Atari's look brand new too! ;)

What are used Falcons going for these days? I haven't had my grimey little paws on an Atari ST type machine since 1990.

I've always been somewhat intrigued by the Falcon but found them to be too costly for what they offered. Now that Atari is no longer in the picture and the Flacom is many years past its prime, what should one expect to pay for a used Falcon?

There were a couple of ST's, a 520 and a 1040, for sale locally, but I passed them up. I think that if I were gonna plop down some dough for an ST class machine, it would have to be a Falcon or Falcon clone.

Thanks,

They are somewhat rare comparted to the ST series. About $300-$400 on eBay
is about right. (USA) I got mine last year on eBay for $325. Nice machine.

Or it could be the Windows configuration. I know some people (like me) who after installing certain programs, suddenly can't read/write Atari disks. The newly installed program must have messed with the registry or something in Windows that causes this to happen. Since virtually everyone has different programs installed on their system, it's a hit and miss.

I have 3 hard drives with different configurations that I pop into and out of the computer via hard drive trays. My Win98SE HD loaded with programs will not read/write Atari disks. My plain Win98SE HD can read/write Atari disks. My WinXP-SP2 HD loaded with programs can also read/write Atari disks (not format them though). I interchange these HDs on my single PC, so it's not the PC. It's Windows.

932. Re: Getting a new (silent) SCSI hard drive/partition sizes

Hallvard, it depends on the CF card. I'm using a 256MB card right now and a leftover 8MB CF card that came with my old digital camera. Both work fine. Cost depends on where you get it. I've seen it on Ebay for $20-$100. I don't know how much it is new from an online retailer nowadays, but back when I got mine, it was about $200-$400. BTW, didn't you ask this before? (or maybe I'm confusing you with someone else?) I know this topic has come up on c.s.a.st many times with the same response. I'm wondering why you haven't taken the plunge and tried this out since you seem to be someone who likes to experiment (Yes, I think you're rack-mounting project is a huge experiment!).

Coda, I haven't tried the Ultra, Ultra II, etc. brand of CF cards. But I feel the regular Kingston 256MB card I use is quite fast. It would be an interesting to try out though...

Henk, I tried the Kodak/Adtron one, and it didn't work when I tried it. However, someone on ATARI.ORG did manage to get it to work. I don't know what he did, but none of my systems recognized it. It's also a "dead-end" drive so you can't daisy chain other SCSI drives. It has to be the last drive in the chain. It was very cheap though.

Bill, I think I have the PC-47B or something like that. It's the one with 2 PCMCIA slots. I have two PCMCIA-to-CF adapter cards for my CF cards. I know the Microtech 3 card model and the PCMCIA/Smartmedia model work too as other Atarians on here have used them with success. Basically, you can't go wrong with any of these 3 Microtech models.

I may accidently have repeated the same question(s) at some time or discussed the same subject at some time ;-)

I'm looking into every possibility of getting a silent drive. The compactflash solution seems like a good one at that, but pricewise it's not that good as far as I can see. Perhaps I could do with a smaller drive than first intended.
But I'm also looking at regular hard drives as there are (supposedly) very quiet or almost silent drives around. I just don't know which ones yet.
This was an issue for me 5 or 6 years ago when I got myself a new drive and ended up with an IBM UltraStar. It was supposed to be "very quiet". hah! What a joke. It whines along like any other drive. Too bad you can't try out har drives before you buy and the specs don't tell you the noise levels (I guess they would sell less if they did!).
But that's several years ago and I'm sure things have advanced since then. Especially since the market has become more aware of computer noise-levels.

If I get hold of a suitably quiet regular hard drive I could try to reduce the noise even more by using one of the many DIY noise-damping techniques.
Then again, with a compactflash card I wouldn't have to bother with that at all. It's all about the money I guess.

Are there other "solid state" drive options around? I've heard of the IBM/Hitachi Microdrives, but these are just another type of Compactflash cards, aren't they? And cost just as much I presume.

> I know this topic has come up on c.s.a.st many times with the

> tried this out since you seem to be someone who likes to experiment
> (Yes, I think you're rack-mounting project is a huge experiment!).

Like I said, it's an economic question.
Other than that, the biggest obstacle I have in order to finish the project is circuit-board designing software. I'm trying out various free

software on a PC, but it's obviously not the usual kind of "click, point and figure it out yourself" sort of thing, and I just haven't had time yet to get really deep into that sort of stuff.
I wish there was an easier way to create high-quality circuit boards. (the STe will have several add-ons and modifications, so I need many boards designed and made before I can complete it).

> Coda, I haven't tried the Ultra, Ultra II, etc. brand of CF cards. But
> I feel the regular Kingston 256MB card I use is quite fast. It would
> be an interesting to try out though...

I assume you've used a regular hard drive before -do you notice any difference in actual use?
May I ask why you got yourself a compactflash for your computer? Is it for getting rid of all noise problems as with me, or did you see other advantages over a "normal" (and cheaper) hard drive?

thanks for that will look into re-routing the sdma clock, could I take a clock from the CT60 ? maybe that would help..... my MB isn't boosted, I used to have Nemesis but took it out cos it was unstable at 24mhz.... wasn't to great at 20mhz either...

I soldered a resistor onto the clock of U36, so getting at the clock that
end is OK, but where is the best source to pickup the clock ? I will put in
a jumper wire instead and give that a try.....

I've seen this problem a few times. I think I fixed it by updatin the
firmware on the CT60, with the JTAG lead. Get the latest version.

I was trying to image some ST Format disks for Exxos the other day. My PC wouldnt read some of the disks. I thought it might be the disks getting old. The same disks however in the Falcon with JayMSA, read perfectly.

Not only could XP not read the disk, Winimage (which is usually good for these sorts of problems), couldnt either.

Coda.

Ya, ive noticed this too, personally i was one of the rare Atari people
in my area. Mostly commodore out here..

Not that this helps him get his falcon tho.. but i can feel his pain, i
always wanted a TT.. only saw 2 in real life in the area.. We had one
Atari store that carried a Stacy and a Mega.. the next closest store
that even knew what an atari was had been a 2 hour drive ..

I bought a brand new Atari 520ST in 1989. I had to drive about an hour out of town to get it; there were no Atari dealers local to me. I now use Macintosh computers.

Oddly, when I bought my first new Macintosh, an LC575 in 1994, I had to drive about an hour out of town to get it as well; there were no local Apple dealers.

I remember when I bought my 520ST, the Commodore line was fairly common in this area. The big chain retailers carried a fair amount of Commodore product at the time. Other than that, the town was pretty much PC

dominated.

Ah, the more things change, the more they stay the same. Sarnia still does not have a local Atari dealer... Not that we ever will... Obvious reasons... But it would sure be nice to have an alternative to the WinTel regime without having to hitch a ride to the next town.

The TT case is even harder to get than a Mega STE case!! Plus the colors do
not match. (TT is white, Mega is ST gray) Just get a Mega STE case from
the atari dealers mentioned above.

I have been doing some research for upgrading my Mega STE computer with a HD floppy. I have a Epson SMD-300 which will fit nicely in the case. All I have to do is take the face off my 720k drive. I also ordered TOS 2.06. Now I have a early revision Mega STE1 (which I upgraded to 4MB) with S/N A1 13... which I read somewhere will cause problems with this upgrade. Anyone have any more info?

Thanks
Tim

Well, I've got a new problem. I just discovered that files, programs, and in some cases whole folders have slowly been disappearing from my hard drive as I'm doing these stability tests. Apparently, as these files/programs/folders are accessed (both read and write), the directory tree is being corrupted. In *some* cases, if I have a backup of the missing file, when I place the backup into the location the original file, either the desktop says that the file still exists and it suddenly reappears, or it will copy it there, and suddenly two copies with the same exact name will be present. But usually, the files don't come back. This has never happened before, and doesn't *seem* to happen using 030 mode. I'm assuming it might have something to do with the SDMA buffer issue? I don't know. At this point, I'm not using my Falcon at all because I have enough reconstruction of software and files to do as it is now. I'm definitely going to hack that buffer out of the machine and do the recommended CT60 SDMA fix. Hopefully that will fix the problem. If not, I haven't a clue what's going on. I'm really bummed because a Natframe theme that I worked on creating for weeks (and stupidly never backed up) is now gone for good, it seems. :(

This definetly sounds like a buffer problem!!! I had this happen to
me!!! Then my NVRam crashed a couple of weeks later. I had to FORMAT
the hard drive and reinstall everything. Since my NVRam crashed I sent
my CT60 and Falcon MOBO to Rodolphe. He fixed the NVRam issue and went
ahead and BOOSTED the Falcon MOBO to 25 mhz system bus. which translates
to 50 mhz DSP and VIDEL. I also have the latest ABE and SDR files on
the CT60's CPLD's. Since Rodolphe worked on my Falcon I have had NO
issues what so ever. In other words NO formatting and it has been over
7 or 8 months. It has run ROCK SOLID without any issues. You do have a
SDRam module that is CL=2 or CL=2/3?? I would say that it is a clock
buffer issue though. Because I did not do this MOD to my Falcon and my
Falcon was STOCK (never touched with any clock buffer mod). I had
issues and when giving my computer to Rodolphe everything worked
FLAWLESSLY!!

Thanks,
Carey Christenson

P.S. Website has been updated to some of the auto pages and family photos. But soon I will be putting up an updated CAB HOTLIST and adding pics of my other Atari Computers and Jaguar Game System. So stay tuned.

951. Very special Atari stuff for sale

Newsgroup: comp.sys.atari.st
Date: 2005-03-18 03:56:18 UTC
From: Mark D <mducksub@notspamatari-source.com>
Message-ID: <pan.2005.03.18.03.56.13.391692@notspamatari-source.com>
Source record: 14328

Hello guys,

For sale is some very special and very rare things. Unfortunately I won't ever make use of them and I'm moving to a small apartment so I have to consolidate my collection a bit into the things that matter most. So without further ado:

1040 STf FULLY setup with Supra hard drive, NVDI, MagiC, HD-Driver, an AdSpeed 16MHz + cache upgrade as well as an XtraRAM deluxe (4 megs of memory). This machine is SOLID! No flakiness of any sort! All manuals and in fantastic condition. This is one of a kind!

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&rd=1&item=5176219180&ssPageName=STRK:MESE:IT

Matrix Coco with Truecolor expansion. This is a VME graphics card for Mega STe and TT. Does something like 1024x768x truecolor with the expansion board fully working. I believe it's supposed to have 2 or 4 megs of ram. Unworking, but should work if someone knows how to put it back together. Please read the description on this one!

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&rd=1&item=5176219334&ssPageName=STRK:MESE:IT

Spectre GCR + disks + 2 floppy drives and power. This is a Mac emulator that should work on many Atari's. Especially ST and STe.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&rd=1&item=5176219392&ssPageName=STRK:MESE:IT

Perhaps one of the rarer items is an AlberTT VME video card for TT or Mega STe. This card works and gives you 1024x768 x 16 colors. All the AlberTT cards I ever seen suffer from some strange ghosting issue and slow scrolling. It's really not that great of a card but it's better than nothing.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&rd=1&item=5176218997&ssPageName=STRK:MESE:IT

Sun 411 Hard drive case. Great external scsi case for Atari falcon :)

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&rd=1&item=5176219427&ssPageName=STRK:MESE:IT

And finally we have a great condition boxed copy of HiSoft Proflight flight simulator. This works on falcon for sure and possibly other machines. Seems better than the microsoft flight simulator. Tested and works.. Check out the pics!

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&rd=1&item=5176219274&ssPageName=STRK:MESE:IT

I think we can do worldwide shipping on all items except the 1040 might not be worth it. If you're having trouble with the links, my ebay

username is dupikachu and you can search by that.

As it goes with these things, thank you for all bids :) It goes to help me get a Sharp Zaurus SL-C3000 which I will promptly attempt to port ARAnyM to so I can do Atari development from anywhere.

Thanks :)

Mark

Source record: 14329

Hard drive noise reduction has been noticed as an issue by Seagate, so they like to advertise the fact that their drives are less than 25 decibels. I only use Seagate drives in my PC (which is also retrofitted with low-noise fans), and they're the most quiet hard drives I've ever used. The Western Digital drives that I used were like tornadoes. I still hear the Seagates spinning, but it's very subtile. It only makes loud clicks when reading/writing.

The Microdrives are basically tiny hard drives so you still hear the clicking noise when the disk is accessed. I don't know how loud it is though.

I used Syquest 270MB drives (13ms access rate) before.I switched to CF. I don't notice any difference between the CF drive and hard drive except for the noise and speed. I went this route due to the noise issues too. I felt like I was losing my hearing which I pointed to my extensive use of computers (and their noisy fans) everyday. I even bought a 4MB 1040STe to replace my MegaST4 because of the Mega's noisy fan. It actually fit better in my music equipment stand than the Mega!

953. Re: Getting a new (silent) SCSI hard drive/partition sizes

Yes, I actually read about noise issues and Seagate drives yesterday
here: http://www.buildsilentpc.com/silent_hard_drive.php
But according to this link:
http://www.silentpcreview.com/article145-page1.html (which discusses and
reviews quiet 2.5" drives), not all Seagate drives are very quiet, so it
seems that you have to look at certain models within the brand, like always.

Now, the issue for me (and probably many other Atari users) is that:

1) I need an SCSI drive (this is for use in an STe or alternatively a
Mega STe via a Link 97 host-adapter which I already have, and adding an
IDE interface would probably be hard and expensive as I don't know of
anyone who sells them any more. An IDE interface for an ST/STF/STFM or
Mega ST on the other hand is much easier).

2) I have a hard time finding small (and cheap) SCSI drives. They seem
to be huge these days and geared towards professional customers. Take
Seagate for instance. When listing all their SCSI drives, the smallest I
could find was 18 Gbytes. For me, that's about 17 to 17.5 Gbytes more
than I'll ever need!
I'll do fine with a drive that's 512 Mbytes, and if I get a 1 Gb drive I
wouldn't have to worry about disk space at all.

3) I could buy a second hand, older drive, but that would mean that I
probably won't have the low-noise types (this is a pretty recent
technology, isn't it) and besides you never know how much the drive has
been used etc. and all of a sudden you end up with a crash.

Suggestions?

Back to drive/fan noise...
I've been collecting information about these issues for a while now.
Here are a few other links which might prove useful:

http://www.silentpcreview.com/ (lots of DIY and other ides for silencing
a computer)
http://www.directron.com/silence.html (another silencing site)
http://www.overclockers.com/tips454/ (making a DIY hard drive "sandwich")

> I only use Seagate drives in my PC (which is also
> retrofitted with low-noise fans), and they're the most quiet hard

> like tornadoes. I still hear the Seagates spinning, but it's very
> subtile. It only makes loud clicks when reading/writing.

I don't mind the clicking/ticking, but the high-pitched, constant
"whine" drives me crazy!
I find it unbelievable that noise isn't something widely discussed and
mentioned in the computer ads. I've only found this issue talked about
in specific environments (musicians etc.), but surely when you're trying
to concentrate on anything, the noise will play a big (and negative)
role for anyone.

I've been using Quantum drives for the most part, and they too make me
want to leave the room.

> The Microdrives are basically tiny hard drives so you still hear the
> clicking noise when the disk is accessed. I don't know how loud it is
> though.

Well, if the acoustic noise of these are the same as the mentioned
Seagate drives I'd save my money and buy a regular drive instead. The
smaller things get, the higher the price, for the most part.

If I could only find a nice, quiet drive with a small (by today's
standards) capacity which is sold today and uses SCSI....

> I used Syquest 270MB drives (13ms access rate) before.I switched to CF.
> I don't notice any difference between the CF drive and hard drive
> except for the noise and speed. I went this route due to the noise

You're talking about the Atari ST now, and not the PC, right?

> I felt like I was losing my hearing which I pointed to my
> extensive use of computers (and their noisy fans) everyday. I even
> bought a 4MB 1040STe to replace my MegaST4 because of the Mega's noisy
> fan. It actually fit better in my music equipment stand than the
> Mega!

Same thing here. I have both an STe and a Mega STe. The Mega STe is of
course very nice, but the fan is very noisy.
When I rack mount one of the computers (not sure which one it will be
yet -the Mega STe is a tad big, but I'll look into it closer when I get
the time as I'd prefer to use it instead), noise levels are going to be
a huge issue. Like you I'm using it for music, and I would ultimately
like to end up with a silent, or near-silent computer.
Good ventilation and a very quiet hard drive or some other storage
solution would help a lot. I don't know if I could do without a fan
completely as I'll be having a lot of extra hardware inside the 19" rack
enclosure, but trying to find a very quiet fan along with temperature
controlling it would most definitely help.

40 Euro for a Mega STe?!!! And fully working?
That's cheap. I can't remember what I paid for mine, but it was
certainly a lot more than that.

I'm curious: since you sound happy about your sale -which new computer
are you getting which will replace the Mega STe?

While emulators are cool, i agree it's just not quite the same as
having the real hardware in your hands.. Thats why i have 20 or so
machines in my garage...

Excellent news. Any chance of some new screengrabs being added to the website please? I'd be interested to see how it renders Slashdot, MSN and the BBC news website.

Simon

965. Re: Getting a new (silent) SCSI hard drive/partition sizes

Newsgroup: comp.sys.atari.st
Date: 2005-03-19 05:28:01 UTC
From: atarian1 <atarian1@yahoo.com>
Message-ID: <1111210081.925384.245300@g14g2000cwa.googlegroups.com>
Source record: 14342

Only the latest Seagate Barracuda drives are the silent type.

My recommendation is TO SPEND THE MONEY AND STOP BEING CHEAP!!!!
Get a Microtech SCSI card reader, a PCMCIA to CF adapter, and a 512MB CF card. There, you have a fast silent hard drive. (I assume you have a host adapter already)

Keep a look out on eBay for the Microtech SCSI card readers. I looked at some completed listings and the last several seem to go for around US$20. A PCMCIA to CF adapter costs around US$10 and a 512 MB CF card costs around US$30. For a total of US$60. That's not bad at all!

Just plunk down the $60 and get on with it...
(And if $60 is still too much for you, then you're using the wrong computers and need to go PC where everything is cheap/free/stolen...)

966. Music Studio songs (Activision)

Newsgroup: comp.sys.atari.st

Hi!

My computer was crashed for 2 months, and it seems I missed some posts
about Activision's Music Studio.
I'm slowly converting Music Studio SNG files to MIDI files with Midi
Music Maker on Atari. I read though that "XMARK64K.PRG" did the same,
but I wasn't able to locate it.

As well, if any of you guy have disks with Music Studio songs (.SNG,
but not SNG from Cubase), I'm very interested!

Cheers
Simon

Nope not all are atari.. Off the top of my head:

1040STf (bumped to 4mb), 130xe, 800xl, C64, 64C, C128,
Timex 1000, TRS80-mdl2, MC-10, Aquarius, apple II+,
AppleIIGS, appleIIC, Newston,MacM100, Mac Portable
(model A), Mac550, PPCMac 6100+dos card, osborne 1
(first run), a Sun/3... a few home built 8 bitters..
some older HP calcs, etc etc ..

Oh... and a DTV64 :)

Hello Mike,
I dont know what to tell you at this point. From reading the docs it says that Nemesis is supposed to be compatible with the CT60. Does it work in 030 mode ok?? I am not so sure that Rodolphe's SDMA/clock buffer mod would work with the Nemesis. Can anyone else verify this?? I am not a Nemesis user so I cannot be sure of this information. I honestly think that you should just do the 'with solders' mod and use the CT60's 40, 48 or 50 mhz. oscillator to speed it up. I know you did not want to do this but it may come down to this at this point. If you are not afraid of doing the soldering this would be the way to go I think.

Thanks,
Carey Christenson

hello simon i'm twent nineyears old and enjoy music making with atari.
my name is charles and i use midi just about every day.
i do not frequently use music studio(but i own a copy of it)

here's my story..... a few years back i had been to a sale a found a bunch of disks...and as assumed a disk full of .sng files,,,,,,...midi track by hybrid arts was the only sequencer i own for years and i thought this disk of .sng files were in conjunction with it. WRONG!
the song files were uncapatible but i kept the disk never less..for 4 years !!!!i had this disk untill two seasons ago...converted all to midi with midi maker v.2...never happier.
lots of titles good piano music rock-n-roll-easy listening....etc.etrc..

so i guess my point is would you like these files in sng format?

they werre all part of a "l.u.s.t." user groups midi compilation or something....

hey does anybody remember "l.u.s.t."?

Well thanks, but I think I have them too, then :)
I've downloaded a couple of disks from a FTP too...
Some conversions sound strange, but anyway, I think I've found back most
of what I was looking for :)

Hey Charles, you helped me a few months ago in finding how to convert
the SNG files to MIDI :)
Thanks again for this, this way I was able to convert the files I had !

> so i guess my point is would you like these files in sng format?

Well, if you have them in MIDI, that will save me time...
I'm converting file I like to play them on an old Oric, which has now a
midi player ;)

I'll write you back privately

Cheers

But make sure you get the sourcepath and destinationpath the right way round - it won't detect a (possibly rogue) file that may be in the destination that's not in the source. OTOH the Egale file comparison feature shows up *any* discrepancy in the two directories, as well as showing what the difference is if files with the same name differ in any way.

>yet to get really deep into that sort of stuff.

There is the (commercial) Scooter-PCB for the Atari (and I think
there is a PC version too, thoough probably in German only). At
one time I distributed an English Atari version, but I have sold
out of all the manuals. You may be able to obtain one from the
author, Dipl.Ing Hubert Kahlert, email info@hk-datentechnik.de
He also has a web page www.scooter-pcb.de from which a trial
version is/was available.

>I wish there was an easier way to create high-quality circuit boards.

Although Scooter-PCB will autoroute, you have to lay out the
components positions yourself and write equations for routing from
the circuit diagram - a little laborious but well explaned in the
manual. You also need to print out the result on a transparent
medium and use this to expose a photo-resist-coated PCB blank, and
then etch it.

Regards, /Peter/

Well, now even bigger problems...

I went ahead and removed the buffer mod (but not the Nemesis) from my Falcon. I replaced the three resistors that were removed in the buffer install, and did the termination resistor modification described on Rodolphe's web site. I put the CT60 back in, hooked everything back up, and powered up the machine. It greeted me with a completely blank screen and no drive activity whatsoever. It seems completely dead. I tested all of my solders, and they seem fine. I'm not sure where to go from here. I don't want to completely remove the rest of the Nemesis unless it's absolutely necessary. I also don't want to have to ship my computer anywhere unless absolutely necessary. Unfortunately, it may be absolutely necessary.

I'm really frustrated at this point. I'm about ready to put the Nemesis buffer back in, remove the CT60 (restraining the urge to chuck it out the window) and try to get things back the way they were before this whole mess. At least it was stable, if slow.

Any other suggestions would be gladly accepted.

I actually have a question. I was playing with the Amiga version and was
able to load Activision's Tass Times in Tonetown title song and play it!!!
But I could not load the file into the Atari ST version. Is there a way to
load Amiga made Music Studio songs and play them???

Extendos Gold is the CD ROM driver that is actively maintained. Roger Barrow of Anodyne Software's Web site also has driver for the Dayna box under STiNG. STiNG 2.6 is the latest.

Thing is a useful replacement desktop. So is Terradesk. Or vice versa.

XAAES is a useful replacement for multitos. So is N_AES, which is payware, and in my opinion, worth it.

EasyMiNT is a very useful and simple way to make either machine into a Unix boxen.

Fortune is a very good file selector for single TOS, but took me a while, and some help, getting it properly configured. Has been a pleasure since then. Boxkite works well under multitos, but it hard to register. The programmer is somehow uncooperative. But it does not need configuring, and will work under multitos.

For desktop publishing, the best seems to be Calamus, which has left its roots. You may need to get an older version to work on your machine. Calamus 2000 is the last that works on a TT with a TTM195 monitor. Tempus Word is a document processor, and a good one. Wordplus TT is a very good typing program. Edith, in my opinion, is the best editor. QED and Luna, and a bunch of others also work.

The best spreadsheet seems to be LDW Power. The best, and only, statistics program is Bstat.

What do you want to do with your two new machines? They are good at a number of things. Oh, and Highwire is the up and coming browser.

You got very good prices on two very good machines. Congratulation, and welcome.

Carey,

Well, like I said, if I can get this to work with Nemesis, I'd prefer that. But at this point, if I can get it to work at all, that's more crucial. I'll just really miss having that extra boost when in 030 mode, and to be able to choose which clock speed to run it at, depending on the situation, which I rely on heavily at the moment with Nemesis (before the CT60 was installed, anyway).

I tried booting in 030 mode, and still nothing. I'm not entirely sure I did everything correctly, either. The instructions on Rodolphe's "no solder" installation page (containing the part about removing the buffer, reconnecting the three resistors, and adding a resistor to the SDMA) are what I tried to follow. However, even though his english is good enough for most things, there were a few things I'm not sure if I understood properly. I'm going to try some other things first when I have time. Then, if all else fails, I'll pull out the Nemesis and install the CT60 bus boost.

Thanks!

Mike Freeman

I use the Dayna SCSI Link T, and it works great. STing IP stack only
though, so you should decide what OS you will use first (Mint or
MagiC, etc.). I use it with TOS or MagiC with great results.

My news server times out fairly quickly, and if it times out I have to re-connect, then Newsie will post my signature twice. If I fail to connect to the server, the signature will be appended each time. Is there anyway to correct this? Anyone willing to work on Newsie some more as an open source project?

Here are some:
http://pages.videotron.com/benoitm/sng_file.zip

Now, if someone could give me the specs of the .sng file format, i could write
an easy song converter!

I had Redmond Cable, here in Redmond, WA make me one for my Commodore 1084 to connect to the Atari ST with attached RCA cable to connect to the monitor. It cost about $25.

This is the only way you are going to get one as these are extremely rare, since you are trying to connect an Atari to a Commodore monitor!

Short answer: No.

That said, anything could be possible with unlimited time and resources, but why would you want to do that?

To Zorro and anyone else using these apps,

This weekend Edward Baiz had pointed out two AWESOME applications!!! They are Zview and Zweather. Now after reading some people were having problems setting up both programs I was beginning to wonder if they were MAGIC/JINNEE compatible as well as MAGXNET compatible. But Edward pointed out to me that they were and I went ahead and installed them. Let me tell you after unzipping them and putting them where I wanted and installing the LDG codecs everything worked right away!!! My HATS off to you ZORRO!!!! These are AWESOME programs and I hope that you continue to develop for the Atari computers. I am awaiting your newest version of zweather since it may have RADAR MAPS in that version.

Thanks and keep up the great work!!!!

From: Carey Christenson <falcon060@adelphia.net>
Message-ID: <423dd9223bc0e42@adelphia.net>
Source record: 14294

To anyone,
I am trying to get my CT60'ed Falcon to use 800XLDJF.app sp that I can transfer files back and forth from my 8-bit 130XE and e-mail off .DI files to a friend. I have gotten 800XLDJ.APP to work with my 1040STf that is using a version number of 2.41. The Falcon version (which is 2.50f) I have to shut off the caches start the program then turn the caches back on. But doing this still does not make it communicate with my Falcon. I do the same thing that I do on my Falcon that I do on my 1040STf by calling up a DOS 2.5 DI image and it just acts like there is nothing there. But if I take the same cable over to my 1040STf and everything works. Am I missing something here?? Do I need some sort of MODEM PORT software?? Not sure what I am doing wrong. Any suggestions would be greatly appreciated.

Thanks,

Two of my finger problems were typing 2.6 instead of 1.26, and Fortune
instead of Freedom. There may be others. StiNG works fine, have not
tried STik.

Jim DeClercq <jimd@panix1.panix.com> writes:

: Extendos Gold is the CD ROM driver that is actively maintained. Roger
: Barrow of Anodyne Software's Web site also has driver for the Dayna box
: under STiNG. STiNG 2.6 is the latest.

: Thing is a useful replacement desktop. So is Terradesk. Or vice versa.

: XAAES is a useful replacement for multitos. So is N_AES, which is payware,
: and in my opinion, worth it.

: EasyMiNT is a very useful and simple way to make either machine into a
: Unix boxen.

: Fortune is a very good file selector for single TOS, but took me a while,
: and some help, getting it properly configured. Has been a pleasure since
: then. Boxkite works well under multitos, but it hard to register. The
: programmer is somehow uncooperative. But it does not need configuring, and
: will work under multitos.

: For desktop publishing, the best seems to be Calamus, which has left its
: roots. You may need to get an older version to work on your machine.
: Calamus 2000 is the last that works on a TT with a TTM195 monitor. Tempus
: Word is a document processor, and a good one. Wordplus TT is a very good
: typing program. Edith, in my opinion, is the best editor. QED and Luna,
: and a bunch of others also work.

: The best spreadsheet seems to be LDW Power. The best, and only, statistics
: program is Bstat.

: What do you want to do with your two new machines? They are good at a
: number of things. Oh, and Highwire is the up and coming browser.

: You got very good prices on two very good machines. Congratulation, and
: welcome.

: megamania <@virgilio.it> writes:

: : Hello everybody,

: : I'm one of the many Atari enthusiasts around the world. Years ago I
: : started out with a 2600, then I owned a few of the 8-bit models, and
: : then the ST line. I think I'm not the only one here with such a past.
: : :-)

: : I recently managed to acquire a MegaSTE, a TT and a Falcon 030 (in a
: : rack) with lots of accessories. I think I managed to pay good prices
: : (10 euros for the MegaSte with laser printer+b/w monitor, 25 euros for
: : a TT with Megafile 44 and a SCSI cd-rom reader, 31 euros for the
: : Falcon with bult-in hard disk and VGA adapter)...

: : I'd like to put the TT and Falcon back to work. I have lots of ST
: : software on my PC, but I don't know where to start from. So my
: : question is: in your opinion, what software should I install on the
: : TT/Falcon (desktop replacements, utilities, etc)? Not looking for
: : games, but for all the things that make the ST line more pleasant to
: : use.

: : For example, what do I need for the TT/Falcon to "see" the SCSI CD-Rom
: : reader?

: : Also, I read that it's possible to connect a TT or Falcon to an
: : ethernet router by using a Dayna SCSI Pocket Link, which I have. Has
: : anybody done it? Is it easy to configure?

: : I'd love to have my two beloved "beasts" (which I couldn't afford when
: : they were raging) up and running again. Unfortunately time is tight,
: : at the moment, and I need your suggestions.

: : Thanks for reading this. Any help will be much appreciated.

If you want to use the Dayna Link, you'll be using the STing driver
from Anodyne software. There is currently no driver for Mintnet, so
you cannot use it with Mint, as for the differences, MagiC is
commercial software, Mint is free. They are both multitasking
environments (TOS replacements that provide multitasking and other
significant improvemnets). Of course, you can just install and
configure STing and the Dayna Link drivers and surf the web using
Highwire under TOS. There is too much to answer here. I would start
by getting STing going with TOS and then research and learn from that
point.

Carey,
I looked into this before, and I believe the Falcon requires some

hardware mods to use 800XLDJ. I wasn't willing to do mods for that,
so I just gave up and continued to use my 1040STe. Check the DOCS
and I think you'll find this.

Get a VME-Bus-Doubler. You can make your own easily:

- Get a second VME Backplane from another TT
- Crimp it parallel on the ribbon cable and let it hang out of the
back of the TT (SCSI plugs will do it).

I did that with my TT and it works with a PAM VME Network Card and a
SANG MV300 or a Matrix Videocard. It does NOT work in conjunction with
a ET4000 Card, e. g. NOVA, Crazy Dot.

>I hope someone has a copy of the disk you need...

No luck yet...

Jochen

The ideal system:

MagiC (6.20 is the latest) as your operating system
jinnee (desktop replacement)
NVDI (screen accelerator/font handling/print drivers)
HDDriver (hard disk driver)
Extendos (CDROM driver)

That will give you a system that will be able to handle the more
up-to-date software such as Tempus Word, Papyrus, Calamus SL2003 and so
on.

If you can afford an accelerator card for your Falcon so much the
better; a CT2 or better a CT60 will also let you add more memory.

> For example, what do I need for the TT/Falcon to "see" the SCSI CD-Rom
> reader?

You will only need a driver (see above) for either of those two.

> Also, I read that it's possible to connect a TT or Falcon to an

> anybody done it? Is it easy to configure?

I don't have experence of this, but your choice of stack will depend on
which one has a driver for the Dayna; MagiXNet has gateways for STiNG
and (my favourite) IConnect.

My Falcon worked very well with a parallel-port ethernet adaptor with a
ROM-port adaptor with MagxNet.

> e-mail?? I know it has something to do with a PRINT.SIC but how do you set
> that up??

I don't know about your first question (maybe set a rule or something,
or drag'n'drop?) but your second one is quite easy.

From the DM-SCRIPTS archive found on a handy website:

PRINT.SIC
Copy print.sic to any directory.
If not installed, copy keywatch.prg (supplied with jinnee) to
c:\gemsys\magic\start and restart the computer.
Open print.sic and edit the paths and save.
Go to jinnee, select PRINT.SIC,
Special/applications/yes
mult.start:never
par.passing: none/
start path: application
Set key to <ctrl><alt>P.
Click OK and save jinnee's settings.
Start lpr.prg (supplied with jinnee), select your favourite font etc.
and save the
settings.
What does print.sic do?
If you use ASH Emailer or any other program that has no print function,
press <ctrl><alt>P. Now the top window is copied to the clipboard and
printed by e.g. lpr.prg or any other printing program.

I have the Nova with the ATI (Mach32) card, and as far as I know the
Nova hardware is the same for ET4000 and ATI, its just the ISA gfx card
thats different, so maybe doubling wont work (I think its an IRQ
problem?)
Anyway, I am doing development for the CTLink Ethernet/USB card. There
will be an adapter for this card to work in a TT/MegaSTe and it will
allow us to keep the VME slot free.
I had thought of trying to double the VME bus, I think there was a card
available at one time called the VME-doppler? If I can get hold of
another TT backplane I may try it. (I have a MegaSTe, which has VME,
but I need to keep these machines reasonably intact for testing).

Coda.

Chris,

Do you have a ripper cartridge? You can scan through the ST's memory
for sprites and then save them to disk. The roms are available
somewhere for download, im sure you can use them with Steem.

Coda.

Maybe an IRQ problem, or an address overlapping, I don't know.

Thats what I am doing currently, though its proving hard as they seem to be encrypted, I've manged to get some stuff with the ripper cartridge by scaning around and alterting modula settings, though most of the graphics seem to be "lost".

Chris,

How far did you get into the game before you "press the button"?
Its unlikely that the sprites are "encrypted" as it would take too many cpu cycles to decode them on the fly. They may be stored in a special format, if the programmers devised a really fast sprite drawing routine that way, but again thats unlikely as theres nothing quicker than a "1-1 copy".

The only thing I can suggest is to get into a level before jumping to the cart, the sprites have to be there somewhere! IF all else fails you could cut them out of the screen afterwards, but that would be a PITA.

Message-ID: <1wcl0g4oi7rco$.ajjoaf4truzj.dlg@40tude.net>
Source record: 14211

I really have to thin out my Atari collection - four complete systems is more than I can justify or find space for! I'm keeping my Falcon and an ST system, but must get rid of the rest ASAP

Anyway, I've a pile of hardware available including two mono monitors, a 4MB STe in a Desktopper, various other bits and pieces of hardware and a large heavy box of surplus serious software (many manuals), plus a number of Atari related books.

I'm not really bothered about getting a huge amount of money for the whole lot, and as some of the stuff is very weighty it would probably cost too much to post. Therefore if anyone in the UK wants all or most of the available stuff they are welcome to collect from South West Wales or I could deliver to certain areas for the cost of the petrol.

Feel free to make any sort of monetary offer, I'd much rather it go to a good home than be put out in the shed where it will be cold and damp and lonely! ;-)

I'll provide a reasonably detailed list of what I have available to anyone that is interested and can wait a few days for me to compile it!

Thanks

From an old post:

The external psu you require is type PS31. p/n CO 70103-3
Input : 240v~ (or 110v ~) /50-60 hz/ 38w
Output: +5v dc @ 3A
+12v dc @ 0.03A
-12v dc @ 0.03A

From the back of the ST. looking at the power in plug and presuming it is a
7 pin DIN socket (U arrangement)
then the pin out from left to right is:

+5v , +5v , +12v , (middle pin not used) , -12v , 0v , 0v

Hey everyone,

During some recent work on my server, I moved my mirrors of ftp.lip6.fr, the sparemint site and repository in it's entirety (1.4GB), chapelie, and ftp.funet.fi in order to rebuild my raid array. What I forgot to do was to disable my mirror script! As a result, all of these sites were redownloaded to my machine in their entirety wasting a load of bandwidth! I'm really sorry for this! On a side note, the Atari-source.org site is alive again. I had to move some things around in order to continue development on the new sparemint site!

Thanks,
Mark

1043. Anodyne drivers and HDDRIVER

Newsgroup: comp.sys.atari.st
Date: 2005-03-22 08:13:52 UTC
From: David Wade <dave@freeserve.co.uk>
Message-ID: <5vydne0Ko5JUTqLfRVnyvg@eclipse.net.uk>
Source record: 14220

Folks,

I recently acquired a couple of Falleron SCSI/Ethernet adaptors which appear to be re-badged DynaLink boxes. Indeed when I try them with the demo version of HDDRIVER 8 they are seen by the DynaLink Sting driver as such. However it then bombs out!. I can think of a number of reasons why this might happen. Firstly the driver says it has "problems" with HD Driver 8 and needs V7, but this seems very terminal. Secondly it might be because the demo of HDDRIVER 8 does not implement a function that the DynaLink driver needs, thirdly it could be because I am loading the driver from floppy and I know it clashes with floppy access and lastly it could be because my DynaLink box is duff. In view of what I paid from them I strongly suspect the latter, and so I am a little reluctant to buy HD Driver before I am sure they work. So to the questions:-

1) Has any one tried the AnoDyne drivers with HDDriver V8 and is my experience expected.
2) Is there a demo of HDDRIVER V7 available, and does the SCSI Driver function in this work so I can test the boxes.
3) Has any one got these drivers to work with any other hard disk driver?

Thanks in advance for any input,

Dave

You could try Steffen Engle (Engel?)'s SCSIDRV.PRG. Try it with and
without HDDriver. I don't recommend it as a pemanent solution (if you
want to keep using HDDriver) as you'd have two drivers loaded at once.

IIRC SCSDRV.PRG is part of GEMAR (tape backup).

Reading what Uwe Seimet wrote about slow writing, do you feel that the
compactflash card makes writing slower, or is both reading and writing
unnoticable compared to a normal hard drive?

US$ 60 ?????!?!??!
I must have completely missed something, because upon searching for these cards I was quoted something in the region of US$ 400, and that was just for the card.
Now, 60 bucks for the lot is absolutely livable, so yes -this is something to consider, and especially if I can get it used at ebay (I assume since there aren't any movable parts inside of these cards, tear and wear isn't an issue as with "normal" hard disk drives.

What do I need the PCMCIA to Compactflash adapter for? I thought there were SCSI card readers available which you just plug the card into. I'm sure I found something like that when Google-searching. I'll try to see if I find it again.

Yes, I've seen it.
The problem isn't finding software that allows me to design PCBs, but
the steep learning curve.
I can't see Scooter being so much easier to use than any of the other
packages on any computer platform, and I surely won't pay 71 or 76 Euro
(depending on which platform version you get: PC or Atari ST) when I can
get a free PCB design program ("Eagle" for PCs) in English (unlike
Scooter which is as far as I know, only available in German).

> Although Scooter-PCB will autoroute, you have to lay out the
> components positions yourself and write equations for routing from
> the circuit diagram - a little laborious but well explaned in the
> manual. You also need to print out the result on a transparent
> medium and use this to expose a photo-resist-coated PCB blank, and
> then etch it.

Yes, it sounds like a nice program, but no more "entry level" than Eagle
I assume. Correct me if I'm wrong, but unless it's not super-easy to use
I'm not forking out that 76 Euro for something I can get free (and in a
language I can understand) elsewhere (although not for the Atari ST).
Anyone know of any alternatives which may be easier to use? This is for
single-sided PCBs which will be pretty simple.

A thought on this...

The CF card can be configured so as to appear to all intents and purposes as a 16 bit ATA IDE drive operating PIO mode 1.
It has no moving parts and faster access times that a standard IDE drive, something like 2ms.

The ceiling bandwidth of PIO mode 1 is 5.22 megabytes per second and some of the figures i've seen show sandisk CF cards sustaining data at 2.5 megabytes per second.

So if the card is capable of outrunning the DMA channel why is it slow?

It's got to be either the SCSI adapter or the driver causing the slowdown?
Or perhaps simply a slow CF card?

e.g. "Manufacturer: Kingston - Part number: CF/2048-S - Warranty: Lifetime
High Performance Premium line of CompactFlash from Kingston. Based on SLC Technology. ATA compatible. 5V/3V, CF Type I, also suitable for Type II systems. 5.2Mb/s Write speed."

When i get around to making my IDE adapter i'll check one of these out :)

The driver does not know the difference between a real hard disk drive
and a CF card, i.e. it will not slow down anything.

My money is on the SCSI converter introducing delays.

It just seems odd that solid state would be slower than mechanical.

Current SCSI/IDE drives are much faster than any CF card, so in general
a CF card is not a good replacement for a real drive. With the Atari
it's different because the Atari cannot profit from the speed of current
hard disk drives, and if a CF card has a transfer rate of, let's say, at
least 2.5 GB/s it's as fast as a hard disk drive with the Atari.

Source record: 14234

Hello, Long time no been here. I have 2 questions,

1. Every time I boot up my TT it's date defaults to a 1989 one, my TT manual got distroyed this winter when the celeing of my trailer came down due to massive leaks in the roof and a ot of my TT/ST books,etc. got soaked and wiped out. Question is, is there a battery that is suppost to keep the date/time current? If so where is it?

2. The same celeing cave in came down on my ST, and after cleaning it and drying it out, the keyboard doesn't work but with a few keys, so I figure the track sheet must have gotten screwed up, everything else works fine. So, is Best Elec. still around? do they still sell the membrain sheet and cost?

And as a 3rd one, is there any TOS 1.4 chip sets still around? This ST has TOS 1.2

After all that I just need to get my JAG's CD to work right.

From: silverdr <silverdr@inet.remove.it.pl>
Message-ID: <42405185$1@news.inet.com.pl>
Source record: 14226

Hi group,

I am trying to resurrcect a ST with ACSI based harddrive interface (German "ProFile 20") but have problems finding a driver that would work. Tried AHDI, tried SCSITOOL with Hushi and everything seem to recognise the drive properly but AHDI doesn't want to format the drive. SCSITOOL does everything apparently (more or less) correct but then crashes on boot. What driver/toolsed is currently considered to be the best and where can I get it from?

Thanks in advance.

Ok, an update...

I rechecked my solders, and one of the ones reconnecting the cut SDMA trace wasn't as solid as I thought. I redid the work, and now it boots, and much more software works with it, including Videlity. Another problem has arrisen, though. Now Nemesis won't work at all. When I run the speed selecting programs (NEM_HI.PRG or NEM_LO.PRG), the system freezes up with light-purple-colored squares across the screen. This happens in both 060 and 030 modes. I'm not sure if there's something I messed up while disconnecting the buffer mod, or if there's some problem with the original Nemesis installation (which I didn't do) that was covered up by the buffer mod.

So, unless someone has any ideas, it appears that I'm going to have to remove Nemesis, as it is now non-functional, and install the CT60 bus mod. This sucks, though, because now I will not have a faster bus and higher resolutions in 030 mode, and I won't have the switchable clock speed like before, which I needed for good speed in 030 modes while having higher resolutions compatible with my monitor.

Any thoughts would be appreciated. Thanks!

Hallvard, have you been in a cave? (just kidding) :-) Yes, CF card prices have literally collapsed. You could get a 1GB CF card if you want for US$40-$50 now. Just two years ago, for that price, you could only get a 128MB card. 16GB CF cards are just around the corner too... :-)

I'm assuming the same thing about wear and tear - there really is none. Since everything is solid state, the only thing that could break it is by dropping it or something...

The Microtech SCSI drives are actually PCMCIA drives - not CF drives. So you need the PCMCIA-to-CF adapter to use CF cards with the drive. I don't know if you can even find PCMCIA flash memory cards anymore. If you do find them, they'll probably be very expensive for high capacity cards. I think the Alesis Quadrasynths still (for some god awful reason) use PCMCIA cards. But I digress...

The Atari version is actually quite simple - you can get a working
layout after a couple of reads of the manual. I think you'll find that
Eagle will have a very steep learning curve.

> any computer platform, and I surely won't pay 71 or 76 Euro (depending

Peter translated both the program and the manual into English. I
believe he still has copies of the program but not the manual.

I see. Didn't you say that you already formatted your drive with
SCSITOOL and had problems with actually running the driver? In this case
you can simply install the HDDRIVER demo on this drive without
re-formatting or partitioning it. The partition layout is standardized,
i.e. it's no problem to use HDDRIVER with a drive partitioned with SCSITOOL.

That's strange because in the past I have sometimes used HDDRIVER with
drives partitioned by SCSITOOL and it worked fine. I guess there is
another reason than partitioning for your problems.
Did you ensure that your drive was actually recognized, e.g. by running
the ID check?

It is recognised properly with the vendor name and model etc. The problem is probably with SCSITOOL not really doing a good job there. My guess is that it didn't really partitioned/formatted the drive properly and later on it crashed upon encountering the results of its own work. That would also explain why HDDRIVER doesn't recognise the partitions.

Source record: 14149

Mike,

I didnt have a nemesis so I cant really say what your problem might be, but before I had the CT60 I had a powerup2 installed with the 74F04 buffer mod. I had a 32mhz 030 with this, and was tempted to leave it in when I did the CT60 install. In fact at first I installed the CT60 without solders, and it was fine with the powerup2, and I was reticent to remove it (and the buffer mod) because I was paranoid about having a slow 030 again. However, I dont use 030 mode anymore, everything I want to use works with the CT60. Sometimes I find the odd thing that doesnt like it, but its usually a "use once" and forget it type app, nothing I need everyday like Cubase or whatever.

I would say remove the nemesis and dont look back (or if you have a second Falcon...). If you need to have an accelerated 030 for any reason you could always put together a DIY speeder very quickly.

Coda.

1073. MegaSTe, TT, and Falcon Schematics for download

1076. Falcon Upgrades

Newsgroup: comp.sys.atari.st
Date: 2005-03-23 19:01:12 UTC
From: Mark D <mducksub@nosspamatari-source.com>
Message-ID: <pan.2005.03.23.19.01.12.590540@nosspamatari-source.com>
Source record: 14153

Hello all,

Several people in the US contacted me for Falcon repairs or CT60 with solders installations. This was back in December or so, since then I haven't heard from these people. Everyone should know I am less busy right now and I am wrapping up work on Carey's Falcon, so I'll have my workbench open soon for another person. I have one person who is coming in next (Ronald), but I know someone named Andrew contacted me and I thought SamF's falcon still needed some help.

PS: Sam, I looked a the Combel a little closer, I think I need a special type of soldering machine for those tiny legs. I don't think I'll be able to fix that for you. Sorry... :-/

Thanks,
Mark

1078. CT60 TOS updated 1.03a

Newsgroup: comp.sys.atari.st
Date: 2005-03-23 19:40:53 UTC
From: NOSPAMS@wanadoo.fr
Message-ID: <1gtw8wk.83j5bw28sttsN%NOSPAMS@wanadoo.fr>
Source record: 14155

Hi,

I have updated again the CT60 archive (boot & CPX 1.03a).

This update is for the Programmable Clock Generator, the CTCM build by
Rodolphe.

The CT60 TOS and the CPX test if the module exist. It's possible to
change the CT60 clock between 66 and 110 MHz by step of 50 KHz.
A jumper exist for get lower frequency 33 to 66 MHz.
The Programmable Clock Generator is installed on the CT60 oscillator
socket.
Sure there are limits fixed today at 80 MHz for the 060 rev 1 and 110
for the 060 rev 6.
You can change the values on the fly for do some speed tests, or change
the boot frequency.

The documentation is on-line, main link inside http://ct60conf.atari.org
or else http://perso.wanadoo.fr/didierm/ct60/pclock-e.htm

You can see my proto with the chip used on the CTCM, a Dallas DS1085-50.

Regards,

Didier.

Hi,
On my 520 STF, the EPSON 480L floppy drive (720K) doesn't work any longer (apparently, the problem is that the stepping head does not move enough)
Any idea where I can find a working original EPSON 480L floppy drive ?

I tried at cps-electronics.co.uk , they recently had a bunch, but sold them out.

By the way, I live in Paris.

Folks,

Just to let you all know that I now have a Farallon EtherMac SCSI box working on my TT030. I am using the demo version of HDDRIVER 7.90 that Ewe very kindly sent me and the Anodyne DynaLink driver. They are very neat and it seems to give good performance but testing is not yet complete. All I need to do now is get in touch with Atari Workshop and get a real copy of the English version of the full version of HDDRIVER v7.90.

Dave.

P.S. the boxes are labelled p/n 572-2 f/w lvl 1.4. The boards in side are labelled DynaLink and they identify themselves on the SCSI bus as "DynaT" . May have one spare since I can only use one...

Thanks, I grabbed it from the link you provided.

I went back there again though, and still could not find it, until I
realized that you have to click on "English" in the side bar, as well as
on the main page. That explains why I could not find it the first time.

Thanks again! :-)

It's a SCSI 2 connector. If you have other devices to connect to the
chain you may want to consider a SCSI 2 to SCSI 1 adapter. I've
found that most of the devices I want to connect use the SCSI 1
standard, and legacy Apple gear is pretty easy to come by that has
SCSI 1. Just FYI

>--
>Joseph D. Place

Well that would explain a lot of things. I had not heard that before. Carey has been going nuts in trying to figure this out. I was trying to help him with no luck at all. I wonder what mods the hardware has to have. I know there is a doc in the 800XLDJ package that talks about the Falcon, but it is in German. I would imagine that it talks about it in there.

Details, details. I think a SCSI 2 connector is also called a HP50,
probably short for Hewlett Packard. They appear on one old SCSI box I
have, a genuine Sun box on E-bay at the moment, and on the very last
external SCSI CD writer box from Yamaha.

It has squeeze latches to hold it in place. If it has screws or wire ears,
it is not what I think of as SCSI2.

My Falcon manual is at home, and I am not.

Jim

If you know about the stepping motor, you may also know where the parts that could use a drop of oil are. You may also know that automotive transmission fluid is an excellent oil for all sorts of things, including head guide bars.

I have a Dysan alignment disk, and have not used it recently, after finding first that quality control on recent drives is much better, and that many alignment problems go away after adding a tiny drop of oil to moving parts.

Jim,

I believe that its a HD50, HD for High Density. SCSI1 uses 50 pin connectors too, in a big centronics style connector (a longer version of the connector on a printer) Strictly speaking SCSI-2 is also about the command set and electrical spec. If Uwe S. is around he can clarify this as im not 'au fait' with the technical aspects, I just know how to plug em together...

Coda.

You're right Coda, SCSI2 is the electrical spec for the bus signals, it can
run through any 50 pin connector.

Source record: 14178

Yes, the specs involved are electrical specs, but they also have pictures,
or drawings, of suitable connectors. And, there are adapters from one to
another available. So SCSI2, or 3, can run through 25 pin connectors, with
the unused lines properly terminated.

I stand corrected on HP instead of HD. But, and this is significant, if
you go looking for SCSI cables, the ones that go from a Centronics C-50 to
a HD50 are called a SCSI-1 to SCSI-2 cable. To those who have read the
SCSI spec, which is quite thick and available as a PDF, what cable
manufacturers do is a mystery. This whole thread started due to what cable
manufacturers do. That controls what is on the packages, and what you ask
for in the dusty stock of your local computer store.

BTW, thanks to someone for calling attention to those connector sites.
They were very good for crosschecking when I put my own termination power,
unfused, into the middle of a ribbon cable in an external SCSI box.

You're right about scsi 1 & 2 and a 25 way.

I'd be VERY interested to see any standard 25 way cable that will run scsi3?
I can dispose of a DLT chassis if that can be done :)

Joseph & Edward,
Thanks for all your help!! I will look into it closer and see what
What needs to be done. But beings we are talking a CT60'ed Falcon, I am
not sure that I am willing to do ANYMORE hacking to my motherboard. It
has all ready had what I consider to much done to it. I did not like the
idea of hacking the Falcon MOBO to bump it up to a 25 mhz BUS and 50 mhz
DSP and VIDEL. But I wanted the extra speed. But as stated I will take
the documentation and have it translated and see what develops. Thanks
for all your help.

Thanks,

Derryck,
I installed the PRINT.SIC per the instructions but I am getting weird results. Sometimes when I tell it to PRINT by either hitting <control> <alt>p or right clicking on the Jinnee desktop and choosing PLUG-INS then PRINT.SIC it will chop off sentances. Sometimes even WHOLE paragraphs come up missing. When I check out the scrap.txt it appears that only parts of an e-mail got copied. Not sure why. Wondering if line length has anything to do with this?? I think I have e-mailer setup for 74 characters. Is this to long and would be causing problems with PRINT.SIC?? Any HELP or suggestions would be greatly appreciated.

Thanks,

Nobody ever said it would be easy. Keep that chassis. But they do make,
and I do have one, an adapter to go from 80 SCA to a 50 pin harddrive
connector, and from there to a SCSI 1 system. That is how I fit new
drives into an old machine. And a SCSI 1 system can be carried on a
25 wire cable. Some of the higher bits get terminated in the process.

So yes and no. One can connect a scsi3 connector to a 25 wire cable, and
get scsi1 out of it it, and put scsi1 into that cable, and get scsi3
out of it. At least, the scsi3 device works without obvious problems.

But if one wishes to split hares, or hairs, one cannot really get all of
scsi3 into a 25-wire cable. It deals with wider signals than scsi1 does,
and if you want those wider signals, you cannot use 25 wire cable.

No hair splitting, i really hoped you'd found a way of getting the full
scsi3 down a 25 way cable :(

The sca -> 50 adaptor will make the wide drive behave as narrow and
unfortunately dlt drives just don't want to play that way :(
It's probably a Compaq "feature"

Source record: 14186

Hi Mark...
I don't have a CT60, but I do have a CT2b...
I mostly run CuBase Audio with a very early/basic mint kernel and
Geneva as the
AES on this machine.

There's something dodgy about my Falcon's audio inputs...
I can not tell you if it's just on the analog end of things, or if it's
DAC related.
Here's what happens...with or without CT2b enabled.

Plug in any audio device...either mic level or line level...and there's
no signal but static.
This is for either channel...right or left.

Using a Soundpool FDI/SPDIF digital input on the DSP port...
I can record through the right channel, but I still get only static on
the left channel.
I have no spare falcon to test the FDI :/ So it could be a bad Falcon,
or...bad FDI.

All the digital output works fine...from Falcon's own outputs, or via
the FDI, also all 8 channels are nice and clean with a Jam Out on the
DSP port.

Also, here lately, I get more bus errors on boot up. These seem to go
away if I let the machine 'heat up' several minutes then reboot. Once
it finally boots clean...it's usually a fairly stable system, and of
course WAY faster than I ever dreamed a Falcon could be :)

Is this something you might be able to look into for me?

Thanks,
Brian

Hello Dave...
Is this a Falcon?

In my personal experience...
If you use only IDE devices on a Falcon, go with HDDriver 8.
If you use SCSI...Ask for version 7.93.

Actually, the SCSI engine in HDDriver 8 is suppsedly
better/cleaner...but Falcons are strange from bird to bird...and...so
much of the older software, CuBase Audio for instance, broke all kinds
of rules to get around hardware related problems that they'll often
choke up with HDDriver 8. The good news is...Version 7.93 is very
close to a dead match 'feature wise' to his younger brothers, so you
shouldn't miss many, if any, 'features' offered by his younger
brothers.

My Dynalink/Falcon setup works great with clients...
I've not had much luck getting it to be stable running servers however.
Perhaps you'll have better luck with server sofware than I have.

Source record: 14190

I recently got my hands on a Microtech PCD47 SCSI Card Reader and a 512mb Type 1 CF card.

Good news..it works fine on a Falcon with HDDriver 7.93 and MagiC 6.1. I've been able to read and write files to the PCMIA slot using a CF adaptor, as well as the inbuilt CF slot of the PCD47.

Now this leads to a slew of unexpected questions.

1. Is it possible to make one of the these cards bootable?
Thus far, I have no luck.

2. Is it possible to get it working without MagiC or MiNT?
Thus far, I can only access the card when using MagiC, and have not tried yet with MiNT.

The only option the device shows up in HDDriver Utilities under is the "Initalize Partition". Beyond that, HDDriver will not address the card (I.E. writing a boot sector, testing, partitioning, etc.)

I tried tweaking the card with Diamond Edge...all it does is tell me that the boot sector is wrong and locks up the system.

Any ideas how to make the card more Atari Friendly...I.E. run under plain GEM? How to boot from it? I'm hoping to somehow hack the reader into a STacy on down the road.

Thanks,
Brian

I ended up making my own Eiffel as no-one in the uk seemed to be offering
them :(

If there's enough interest i'd probably consider making some.

Bootable on a Falcon? I don't know. Why would you want to? If you want to boot off of a CF card in a Falcon, it would be much cheaper and easier to get an IDE-to-CF card adapter and hook it up to the internal IDE port in the Falcon.

I have a Microtech 2-card reader which I use to boot into regular GEM on my STe with ICD Link 2. I just formatted, partitioned and installed the boot sector using HD Driver just like a regular hard drive.

I think your problems is with the Falcon. They're finicky little things. I have that problems like that too with a variety of drives. Just keep trying I guess?

Brian,

I have been thinking hard about doing the same thing for my Stacy and also my TT. I think a better way to go would be a SCSI => IDE convertor, then IDE => CF adapter rather than a SCSI => PCMCIA => CF.

Regarding access from Magic, did you partition & format the card on the PC with windows? To access with GEM you need a TOS compatible partition, which windows will not give you. When you go into hddriver, what does it tell you under ID check, and SCSI/ATAPI dialogs? I am a bit surprised that you cant get the partition dialog up. I would put hddriver on a clean floppy, use auto configuring, then boot from this disk, and see whether you get the partition option.

You do realise, than on the Stacy, you would actually be doing ACSI => SCSI => PCMCIA => CF conversion? Thats a long way round, didnt somebody design a simple IDE adapter for the ST range?

Coda.

1122. Mystery Falcon Modification

Newsgroup: comp.sys.atari.st
Date: 2005-03-25 08:35:18 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <c1Q0e.87338$%Y4.18705@bignews6.bellsouth.net>
Source record: 14049

Greetings.....

I have 2 Falcons here both with a similar modification.

I believe it has something to do with a Clock modification but not
sure.

The modification is a chip piggybacked on top of the socketed U63 with
several
wires running to the removed resistors R221, R222, and a few more in the
general area.

I remember in alot of upgrades like the Nemesis, these same resistors
have
to be removed and wires connected to them.

Does anyone know what this modification is called and what
exactly it's suppose to do?

And what performance gains if any are expected?

This modification appears to be the only one on the boards.

Any info is appreciated.

From: Phantom <phantomm@bellsouth.net>
Message-ID: <ZeQ0e.87361$%Y4.82314@bignews6.bellsouth.net>
Source record: 14050

Greetings again,

The other day I got busy looking thru some Atari advertisements and other papers.

I ran across a large card that came with some Falcons that described the monitor
adapters. And to my suprise, I found that Atari made a third adapter with RCA
type connectors for connecting to VCRs and TVs or Monitors with RCA jacks.

This was a real surprise to me as I could use one or two of these.

I bought a Composite cable years back just for this purpose, made by Chro-Magic IIRC.

In all the years of reading this newsgroup, Atari Magazines and etc. I have
never seen nor read anything about this adapter.

Does anyone have a few of these for sale?

Contact me if ya do. I have extra VGA and RGB adapters, some new in the package unopened.

Thanks,
phantomm@bellsouth.net

1124. Where is the Shareware?

Well, I'm afraid that I can't offer much help. I don't remember having
used that script. There's nothing on the face of it that would stop it
from working.

> to do with this?? I think I have e-mailer setup for 74 characters. Is this
> to long and would be causing problems with PRINT.SIC?? Any HELP or suggestions

The obvious first thing to try would be to try the script with another
app (any one which allowed you to select all text copy and copy to the
clipboard) to see if it's an Emailer problem or not.

Other routes would be to step through the script manually (ie select
and copy to the clipboard yourself) and see whether an edited script is
able to carry out the rest of the operation.

I can't see that line length would have anything to do with it offhand.

I think that there might be some kind of bug in the way ARP frames are
handled in the Anodyne software. Roger was hinting he thought Windows was to
blame so I was going to test things with my SPARC station to eliminate any
MS bugs.

> Perhaps you'll have better luck with server sofware than I have.

I we can isolate the bug I think all server software will work better.

I must say they make a really neat solution compared to the EtherNec "bodge up" that I use on the STE.

I wonder how many of these things were made? I bet that there are still a few on Apple dealers shelves wit $250 price tags on. I also noticed for the US readers that the "pocket" versions pop up on E-Bay at regular intervals (I think some one has a box full) for $20. There is one there now:-

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=6754547200

I think these are basically the same, but you need to fix the PSU as it looks like it wants a MAC keyboard (or possibly modem/printer) socket!. (Actually if its a serial will it work in te TT's network port ? That would be real neat).

That's not fair, Steve! Perhaps Ben has multiple personalities, and each personality was born on a different day. Conceivably, with multiple personalities, Ben could theoretically have a birthday everyday of the year.

Another possibility, Ben could be illiterate and unable to read the date on his birth certificate. If this were the case, it's possible that Ben is just guessing when his actual birthday is. You know, waiting for somebody to come along and say, "Yes, Ben, it is your birthday. You finally got it right!"

Perhaps Ben is just delusional. Perhaps we're just delusional and Ben doesn't even exist. That's it! We're delusional and Ben doesn't even exist. So let's just move along and leave our imaginary Atari 8-bit dealers behind.

Hello,

Are there some Calamus SL 2003 there, who use it on real Ataris
(Falcons, TTs or Mega-ST(e)s, but no PCs nor emulators), and who own
either Bridge 6 or Calipso 3 last versions ?
If so, could you manage to use those modules ?

TIA,

J.-Luc

I use Calamus SL3/Bridge 6 on the Hades. I use Bridge mostly to convert
Calamus docs into postscrip files. So far no problems.

Yeah it suits me as other feeds are locked down at work, where I seem to have more free time than I do at home...

Anyway, If Ben stopped posting his spam, we wouldnt have this discussion every few weeks. I (and a few others here) reserve the right to make comment at his persistant unsolicited commercial postings, and we will receive rebukes because of it. No wonder there are so many lurkers on usenet that dont actually say stand up and anything for fear of being abused...

Coda.

Hmm, I've had several dealings with Bravo Sierra Computers, all favorable. I have to admit, some purchases were because of their postings here. Every one is entitled to their own opinion of course, but I wouldn't call it spam by any stretch of the imagination. I don't have a problem with one of the few Atari supporting dealers in the US posting here. Perhaps he could cut down on the number of times he posts? Just a thought.

>Thanks,

Carey I would feel the same way in that I would not want anymore hacking on
the Falcon motherboard. I would just use your ST and then transfer the files
to your Falcon or Mac. I suppose you have already tried running the ST version
of the program on the Falcon. My guess is that it would not work too well.

It is spam, its unsolicited, its advertising, in a non-commercial base.

It was suggested before that he limits his posting but he refuses to
compromise.

Hey. Well, how about some of us coming up with some useful comments and suggestions on how he can reach the Atari user base, without incurring a costly overhead? That seems like a sensible approach to me.

Like I said, I'd hate to see one of the last/few remaining Atari dealers in the US gone, because he can't reach the very people who are his customers.

I don't think they should be posted here at all, regardless of whether he's
one of the last or THE last, this is a non commercial base, and if every one
of the last remaining dealers were to post here (even every birthday)
there'd be a lot of commercial traffic.

Sorry, but Hades isn't a Falcon, nor TT, nor Mega-ST(e), so, in my
definition, no real Atari.
I need to know if "real Atari" users do experience problems.
I know it works on PCs, we know now it works on Hades too, but so far
it still doesn't work on my 3 Falcons nor on my TT, neither under
MagiC!, nor under plain TOS.

Thanks anyway,

So we Hades and Milan users are not real Atarians? :-)

IMHO, the Hades comes pretty close to the TT. Almost every soft running
on TT does run on Hades. I really see no reason why these modules refuse
to run on so called real Atari's. If they run on Hades they should run
on TT too. The ony explanation for that behaviour I can think of is lack of
memory and power. Bridge demands alot of the system.

Steve,

Ben's persistant e-mail on here does brass me off from time to time, but as other have said where else should he go? Having had mail to two dealers (Atari Workshop and Behne & Behne Systemsoftware GbR) either bounce or go un-answered for over a week (and yes I tried phoning Atari Worksop as well) I am begining to wish that more of them posted on here with contact details. Any suggestions on how to get my NVDI (legally) updated to V5 witout contacting these two would be gratefully received. I would also like a pointer (if possible) to some english web pages for Magic (I ave 6.0), or have ASH folded the Atari operation as well!. The way things are going ST's are going to be useless not because we can't get 680x0s any more but because you can't legally get any software!

Dave.

P.S. How many votes do you need for a new news group? comp.sys.atari.ads any one! Or could a vote be taken on updating te consitutuion here?

Thanks for the info Mike.

I'm a bit confused on something. Were there any Atari Falcons
made by Atari that didn't need this Clock modification because
a Factory modification or revison was made?

Would you happen to know if this modification goes bad if it would
cause the Falcon video to go Black and or would it cause the
Falcon to appear dead?

My first Falcon was a stock TOS 4.04 4meg unit with no modifications.
I did alot of D2D recording with no problems at all.
Now I have a Centurbo II version B installed by myself in the same
Falcon and it works great.
Although I did run into a strange problem with HD Driver.
I could not get my SCSI hard drives, CD-Rom, and CDR drives to
be seen in the Turbo modes.

The Fix was to select Cecile in the CT2B menu and all SCSI devices
worked great from then on.

I'm not knocking HD Driver, it's a great program. But the version I was
using sure did not work with my CT2B setup. Maybe a newer version
would work. It looked like a timing problem to me. Everytime I'd
try to bootup with the SCSI Drives attached HD Driver would not
see them, However the Leds on each drive would blink but not
like they normally did during a working bootup.

I recall discussing the Falcons SCSI timing with Alex at ATY Computers.
It seems that there's a fine line in the SCSI system and if the signals
don't arrive at the proper time upon booting, then the SCSI Devices
will not connect up to be used by the Falcon.

If I'm not mistaken, the CT2B speeds up the SCSI system in Turbo
Modes. I'd have to check the Docs to be positive on that. So it
may have been that the signals to the SCSI Devices were faster
than normal causing the problem.

Back to Stock Falcons.....

I remember reading about some new factory Falcons having clicks and
problems
when doing any D2D recording. I am assuming this is part of the
reason for this Clock modification?

I also recall discussions about the metal shielding on the factory IDE
hard drives.
I'm not sure what the problem was, but I remember discussions on moving
the
shielding to the other side of the IDE drive may fix the problem.
I think it may have been sometype of IDE hard drive problem and it was
thought
that interferance from the PowerSuppy maybe causing the problem.

I never installed that shielding when replacing the factory IDE with
drives that had
more space on them. And never had a problem to my knowledge.

Do you remember what that IDE problem was all about and what the IDE
hard drive shielding was really for?

I have a 1040STe that has a Composite Video modification.
It's a simple mod just a Female RCA jack and a few wires soldered.
It allows you to connect the video to a VCR or etc while still getting
your normal display on your monitor.

It gives a very clear video display even when recording to a VCR.

Wouldn't it be possible to do the same modification on a Falcon
and get similar results when using the RGB adapter?
And couldn't the wires be soldered to the inside of the Falcons
fixed monitor port so that the RGB Adapter wouldn't have to be
hacked on?

Hi again,

Here's another update... I now have CT60 working *with* Nemesis (no buffer) *and* Videlity, but only in 16 or 25MHz mode. 20MHz doesn't work. I'm having a horrible time finding any nice high resolutions that work, but at least it is working and pretty stable.

Some strange things, though. Hard disk drivers won't work, except for AHDI. CBHD and the HD Driver demos (no matter what the version number - I have some older 7.x demos) report an IDE drive that's not there, detect my SCSI drive on SCSI 00.00, then freeze up. AHDI works fine, but is dead slow, and my CD-ROM drivers won't work with it.

Other than this, everything seems to work, and it's nice and fast and stable (no more missing files!), especially with the 25MHz bus! I read somewhere (DHS's BBS, I think) that someone has had a similar problem. If anyone has ever solved it, please let me know! Thanks!

Mike,

Dont know why CBHD and HDDriver dont work. I think they both use the scsidrv interface? (which I think Extendos needs to work). Theres no way you should have to resort to using AHDI.

With the IDE, sometime ago I was having two ide drives being reported although I only had one. The second drive was coming up as "¬¬¬¬¬¬¬¬¬¬¬¬¬¬¬¬¬¬" so I figured there was noise
on the bus/cable. However everything worked OK so I didnt fret. When I rehoused into a rack mount, I changed the IDE cable and put a CDRW on the end, and the ghosts went away.
Do you have your IDE cable plugged into the motherboard, even though theres no drive on the end?

Finding a good resolution can be a pain in the ass, I ditched videlity and switched to centscreen. Theres not much between the two, they do the same thing, I just found centscreen (the one with the CT60 patch for 50mhz!) a little easier to use. I have 800x608 with the 50mhz videl clock, which is 49.8khz x 76hz.

Coda.

Coda,

No, I don't have anything on the IDE connector. Everything I have
is SCSI. Your "ghosts" are exactly what I'm getting, though, plus, when
it detects the first SCSI drive, it freezes (crashes?). This didn't
happen until I took the Nemesis SDMA buffer off the system and restored
the SDMA clock trace connection back to its original state and added
the resistor that R. Czuba recommends.

As for the resolutions, my monitor is great for clocking down to an
RGB resolution from time to time, but unfortunately, its upper limits
are around 39khz x 72hz. When I use the settings you give above, the
screen is distorted and eventually begins to roll. I could get a really
nice 800x608 with 38khz x 70hz with the 20Mhz Nemesis clock, but that's
not usable at the moment. I can get some *really* high resolutions
using Interlace mode, but that gets hard on the eyes after a while.

I use 928*704 in 16 and 256 colours (44.8khz*62hz) noninterlaced on both,
ct2 and ct60 with bus at 25mhz. They are pretty usable, esp since Rodolphe
use stram buffering.. I just realised u cant go over 39khz... Maybe time
for new monitor?

> So we Hades and Milan users are not real Atarians? :-)

I was nearly sure it would lead to misunderstanding... but it's my
fault : being able to speak a language is one thing, but there is one
thing we aren't taught at school, it's thinking like the people that
speak that language. So, words sometimes don't come the way they ought
to. I ought to have written : "Atari-made" machines, it would have made
things clear. So I apologize to everyone my words might have hurt.
In my opinion, every user of a TOS-based system is a real Atari user.
So let's extinguish the fire I started, and back to the topic...
>
> IMHO, the Hades comes pretty close to the TT. Almost every soft running
> on TT does run on Hades. I really see no reason why these modules refuse
> to run on so called real Atari's. If they run on Hades they should run
> on TT too. The ony explanation for that behaviour I can think of is lack of
> memory and power. Bridge demands alot of the system.

My Falcons all have 14 MB, and my TT 32 + 8.
In fact, I think the test on my TT is valueless, since I discovered the
data on the partition Calamus is on are corrupted - I'm trying to
recover them from backups I made, but I'm afraid this happened
before the oldest backup I own :-/
I think all got worse when I copied Calipso & Bridge onto my TT to find
if it was better than with the Falcons.
However, the developper in charge of Calipso made me find that all
works fine until I turn "Textimport" on - then it crashes.
Hope he'll find the cause soon...

Internet Home Business

Minimum financial requirements:
Any credit, debit or bank account with at least $6.00 balance.
Minimum computer literacy:
Follow onscreen instructions and operate a mouse.
Minimum time investment to start:
Approximately (5) hour's computer time on-line

"THIS IS A LEGAL BUSINESS OPPORTUNITY!!!"

#####LE 18 Sec. 1302 & 1241 of the Postal lottery laws, provides guidance to the legality of this specific business opportunity. The policy and procedure of this venture is discussed in depth at Fairhaven College Discussion Board link below:
http://pandora.cii.wwu.edu/WebServices/_generaldiscussion/00000040.htm

No Fake Names! No False Information! Follow Policy & Procedures with Integrity!!!

"This program remains successful because of the honesty and integrity of the participants. Please continue its success by carefully adhering to the instructions. In this business, your product is not solid and tangible, it's a service. You are in the business of developing mailing lists. Many large corporations are happy to pay big bucks for quality lists. However, the money made from mailing lists is secondary to the income, which is made from people like you and me asking to be included in that list."

Example: $6.00 + 5hrs. + Integrity = $20,00.00 in 4-6 weeks

Step1. Go to www.Paypal.com, open and activated an account for free that allows you to send and receive funds via secure e-mail notification. This may take a couple of business days to verify account information and confirm identity.
Step2. After activating your Paypal account, use your new account to pay $1.00 to the following email addresses in the order they are listed. (Total $6.00)
1. (njekm@hotmail.com) 2. (wthampton@hotmail.com) 3. (Ldrury@rock.com) 4. (samwkfld@yahoo.com) 5. (1damnyankee@comcast.net) 6. (katama1965@mail.com)
Step3. Email each of the six email addresses and request that you be added to their lists.
Step4. After requesting that you be added to each core lists, edit this notice as follows:
Move everyone in the core mailing list up one position eliminating the

first address. Place your email address in the sixth position and save document.
Step5. Find Internet newsgroups, discussion boards, message boards, forums, chats, in financial services field and post this notice a minimum of 200 times. The more postings, the bigger the list and the more return. That's it!

Again I cannot emphasize the importance of following each step carefully and honestly.
Good luck. God bless. Watch the money role in.

The same rules apply as for SCSI hard disk drives. If you cannot boot it may be because your card/adapter requires initiator identification, which TOS (TOS contains the boot code, not HDDRIVER) does not provide.

> 2. Is it possible to get it working without MagiC or MiNT?
> Thus far, I can only access the card when using MagiC, and have not
> tried yet with MiNT.

MiNT should not care about the device type.

> The only option the device shows up in HDDriver Utilities under is the
> "Initalize Partition". Beyond that, HDDriver will not address the card
> (I.E. writing a boot sector, testing, partitioning, etc.)

HDDRUTIL requires the SCSI driver to be active for many functions. Did you switch it off? With HDDRIVER 8.1 it is mandatory, but with 7.93 you can switch it off, losing functionality.

I think that you are probably better off getting an eiffell, and then
using a PC type mouse of your choice. Most USB mice still come with a
PS/2 converter, and the ones that dont will probably understand the
PS/2 protocol if they are plugged into one.
Either that, or wait a while for the CTLink/Ethernat and you can have
your pick of optical/wireless whatever... :-)

Coda.

1199. [UTD] April Release of Eureka

Newsgroup: comp.sys.atari.st
Date: 2005-03-30 11:14:15 UTC
From: Francois LE COAT <lecoat@atari.org>
Message-ID: <424a8a07$0$19345$8fcfb975@news.wanadoo.fr>
Source record: 14026

Hi,

The software "Eureka" is updated and released on its WEB page.
It is a "2D Graph Describer and 3D Modeller". You will have to
fetch it at :

http://eureka.atari.org/eurka504.zip
That is the Complete Common Edition

http://eureka.atari.org/eurka020.zip
Is the Complete 68020 Edition

http://eureka.atari.org/eurkafpu.zip
Is the Limited FPU Edition

http://eureka.atari.org/eurklite.zip
Is the Lite Edition, working on early ST with 720kb floppy

http://eureka.atari.org/lib_dgem.zip
Are Dynamic Libraries Extensions for Eureka

http://eureka.atari.org/tiny045.zip
Is the OpenGL Extension (requires previous package)

This new release is built with GCC 3.3.3

I wish you big fun with all this new STuff !

Best regards,

-- François LE COAT

Source record: 14027

There may be a service manual, and if there is then I guess it would be described in there.

I have just opened my Stacy (two days ago) so I can tell you how, but you have to be carefull.

The key to it, is the two screws at the bottom of the screen behind the Stacy badge, and the clips that are around the case edge. Remove all the screws you can find, including the two in the screen. Go round the screen unclipping it using a thin flat screwdriver pressed into each clip (gently). If you look hard you can see where these clips are. Dont mangle the case.
When you get the screen open, unscrew the spring loaded pivot on the lower right (dont worry its not loaded up). Open the main case the same way.
If you have taken an ST apart before the inside will look familiar. The drive cradle is secured to the motherboard assembly with two screws. If you undo these you should be able to remove the cradle easily, then change drive. The 20mb unit in mine was bleeding a strange sticky goo. Im just awaiting delivery of a 512mb CF card, and a SCSI=>IDE adapter so I can replace it.

I took pictures while disassembling my Stacy, and I havent had chance to put them up on the site. If you are not in a hurry and would rather see inside before opening yours could you wait a couple of days for me to get the page up?

Coda.

Youre probably missing a GAL update that is required for the HD to work, also you will need the later version WD1772, called the Ajax. Later MegaSTe's came with the right GAL and Ajax, earlier ones needed updating.

Try best electronics, I think they have the GALs and IIRC the Ajax, but the Ajax is probaby extremely expensive.

Coda.

Source record: 14030
Cross-posted to: comp.sys.atari.st.tech,comp.sys.atari.st

Here we go again. The Ajax has nothing wrong with it, but it will run at 32 MHz, which you need for 2.88 meg disks. If you want to use 1.44 meg disks, you need a 16 MHz clock, and a WD1772-02-02 will do that. For a 720 Mb disk, you need an 8 MHz clock and a basic WD1772, with any suffix other than 02-02, will do. Buy an Ajax if you want to, but you do not have to, because there is not a 32 MHz clock switched to the disk drive circuit.

All that being said, those are gauranteed values. An actual bottom-line WD1772 may actually operate at a much higher speed, and may work fine in a drive circuit hacked to switch in a 32 MHz clock signal.

The Ajax chip, dimly recalled, is about 45 USD.

All of mine can. The problem is that there is, from the only sources I know of, a minimum order charge, and a postage charge, so that one switch can cost about 10 USD. I bought a lot of the little switches, and have used a few of them. My mice all click.

Message-ID: <pan.2005.03.30.16.35.14.360699@charter.net>
Source record: 14033

I'm trying to find BBS Express ST! software. I had this at one time, in fact I used it to run "The DarkForce! BBS" years ago. Actually, I've still got the software backed up on harddrive and Syquest carts. What I don't have now is the manuals or disks. Sadly, somewhere, somehow, they've been misplaced or thrown away.

I just recently bought BBS Exress ST! software from Bravo Sierra. Unfortunately, its an older version, while it was still maintained by Keith Ledbetter (there's a name from the past, anyone know where or what he is doing now?).

So anyways, if anyone knows where I can buy original disks and manuals I sure would appreciate it.

Thanks gang.

Why don't you just send Ben a clear message that he will understand? If everybody responded to Ben's posts with an email, he will get the message.

Whenever Ben goes on a posting binge, just send him a simple email with the following subject and body:

Subject: One Post/Month To comp.sys.atari.st

Body: Please post only one commercial spam message per month to comp.sys.atari.st please.

I mean, why not fight fire with fire? You could always create a Hotmail or Yahoo webmail account just for such a purpose. If everybody starts flooding Ben's email box with comments like this, he'll get the message. He may even discover how truly annoying his posts are.

Just a thought!

David,
I agree...something's fishy about ARP frames or something...I'd really like to see MiNT/Magic-Net drivers for this box...While the EtherNEC works with my Falcon CT2B, it'd sure be nice to get my dongle port and desktop space back :) My most-used software all comes with ROM-port dongles :/

Ultimately, I end up using either MagiC, or a really old MiNT/Geneva setup with no MiNT modules. This happily loads STiNG and all its CPX parts. Sadly, the later MiNT kernels that support VFAT partitions all crash on me when trying to load the STing CPX setup modules.

I've read there was at one time a little application that reads all STing's setup information from a text file and sets it up so the CPX modules are not required, but I've never been able to actually find this piece of code.

I've heard many a times that doing a MiNT-Net module for these would be easy for a programmer, but I've yet to see one appear. It's true that there is a raw SCSI module in the MiNT distribution and the sources are there...where in theory one could plug in the device specific commands, tho it seems to me this module is for doing TCP/IP over the SCSI bus itself. It's all just so far over my head.

Brian

Um - no. The datasheet says the 1772-02-02 is good up to 10MHz, not 16, and
there have been lots of them that do not work reliably at 16MHz.

I am currently talkin to Roger about this, but he is busy with his
commercial stuff. Perhaps he will lend me the driver source.....
If you use "arp -s" to set a static entry on the client box it works fine.
Of course if the traffic is coming via a router then this needs to be done
on the router, wichh might be tricky. I get the same issues when I use a
Sparc Station with Solaris 5.9 as the client. The "slstingx" utility never
reports any received ARP packets...

> I'd really

Because it needs to poll the SCSI I guess there might be trouble on
multi-tasking OS, but the STING drivers seem to work fine under MagiC 6. I
wonder why development stopped on MintNet divers...

> Ultimately, I end up using either MagiC, or a really old MiNT/Geneva

I need help installing this app, cause it's really giving me fits.

I got the app from http://www.zhell.co.uk/magdisks.html,Atari ST User Coverdisks.

Anyone got a digital copy of the install docs they could email to me?

Thanks,

STOP!!! Before going to Auction... Experience Sales, Service and Support! Listing Lower Prices with Dealership Standards! Selling Used & New Atari Games/ Software, Hardware, Books and Accessories! Classic Atari 8 Bit and Atari ST Computer Lines Plus Atari Jaguar Consoles and Games! Come for the Savings, stay for the Service! The Rainbow ends at Bravo Sierra Computers!

http://BensCatalogs.Atari.org Click Here to Save!

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods! So not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you may not be able to find anymore at Swap Meets, Thrift Stores or even Auction Sites! And I sell for less! And unlike those who will remain anonymous! I test Goods before I sell them. So not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, partly because I'm the guy most people come to when they want to give their Ataris a New Home! I'm saving Orphaned Atari's from Oblivion! Goto http://BensCatalogs.Atari.org or Call (503)256-9974! I'm not asking a lot, I'm just trying to make a living and I'd like to earn your Business!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

From: Uwe Seimet <Uwe.Seimet@seimet.de>
Message-ID: <3b21v8F6dpkj5U1@individual.net>
Source record: 14102

Hi,

starting with tomorrow I may not have constant write access to internet newsgroups anymore because I will depend on public servers with write access.
So in case of any HDDRIVER support questions it is best to send me an email instead of expecting me to answer in a newsgroup. Thanks!

Best regards, Uwe

I have an old 520ST with boot Roms and I was playing around with it. (For Nostalgia only since it's kinda useless, Nice Boot Menu though!) I have a TOS 1.0 boot disk that I use with it (and my other ST's too to load old games!) Works fine. I also found a TOS Boot disk that seems to be a beta or something. It has a green/white checkered background (like in TOS 2.x) and also needs to be reloaded after a reset. Is this the actualy TOS Boot Disk the early 520's came with? Or a beta disk? The Atari Logo also looks weird in the about menu. Anyone have a image of the original TOS disk they could send?

Thanks!
Tim

I dont remember where, but there was a site with pretty much every
version of TOS known to man.. I think i found it via an emulation
link..

As a side note, I wouldnt say a 520ST is "kind of useless" if it still
works..

1239. Re: Ben's Atari Birthday Bash!

Newsgroup: comp.sys.atari.st
Date: 2005-03-31 21:05:02 UTC

Source record: 14116
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

That's what I mean. If 50 to 100 people were to send Ben the same email, he'd get the message.

These are my observations:

a) Ben provides email addresses in all of his newsgroup posts.

b) Ben does not appear to reply to any messages on the newsgroups.

From these observations, it is possible that Ben does not even read the newsgroups. I would hazard to guess that he spams the newsgroups and leaves. If Ben wants anything from the usegroup community, he expects the newsgroup community to contact him directly.

This is my rationale:

Nobody appears to police the newsgroups. This is both good and bad; nobody interferes with the newsgroups but the newsgroups are open to abuse. Therefore, it is up to the newsgroup community to police their own respective newsgroups. If constant and considerable SPAM is occurring in a particular newsgroup, it is up to the users of that newsgroup to make it known that Spam is not welcome.

Another observation that I have made:

c) Ben crossposts his Spam to several newsgroups.

So, from these observations, I would conclude that the "No Spam" or "Limit Spam" message must be taken directly to the spammer. You could build your "Anti-Spam" forces by enlisting the aid of the users of the other cross-posted newsgroups.

If Ben iqnores a proactive approach by the members of the newsgroups that he is spamming, then that says alot for Ben and the type of business that he is running.

Just my thoughts on the matter.

BTW: I am willing to participate in this "proactive" measure if anybody else is willing to join me, perhaps we can achieve some satisfactory results for all involved.

I, personally, don't think that Ben's messages should be altogether banned from the group, I just think that he should be a little more considerate to the other group participants.

There's absolutely no reason for him to spam the newsgroup as often as he does. Besides, if his customers are as pleased with his service as he claims they are, word of mouth will keep him in business.

If anybody on comp.sys.atari.st or comp.sys.atari.8bit were looking to buy anything for their systems, they'd probably make an inquiry on the newsgroup. Anybody that has had good dealings with Bravo Sierra Computers would probably reply by saying, "Hey, try Ben at Bravo Sierra. He might have what you're looking for."

There's really no reason for Ben to constantly Spam this newsgroup.

Know what I mean?

I do agree that they are quite frequent, but I believe he does put AD
in the title at the beginning. It takes a second to delete.
Personally I feel it gets annoying seeing it on a weekly basis, the
same ad, but it takes a second to delete. When I post about my site,
I put AD at the beginning, but I only posted when my site was new. I
will be posting when I have new stuff of interest for those certain
groups (ie. if I get new Atari ST stuff, I will let that group know,
or Commodore 64, the same). I think he offers a valuable service, but
expensive. I am sure he bought out stock back in the day and he might
have a store front to deal with, but I feel you need to have prices
with what the buyers would pay.

There was one site I found:

http://homepage.mac.com/carlhafner/AtariTOS.html

And if you try the disk_tos100.st this is the one I am talking about!

Is this the beta TOS disk that was supplied with early 520ST computers?

What I meant as useless I mean once you load the TOS the computer has less
than 200kb of memory, so it is useless! ;)

Tim

Hello all

Just some word to announce MyAeS 0.67 after 6 month of work.

This is a modern AES working with Mint or above any other AES for test.

You can find it at:
http://myaes.free.fr/

or look some snapshot here:
http://myaes.free.fr/capture.php

There is some new feature, never see on other AES and working with all
applications like windows bookmark, universal background desktop etc.

If people would just apply a filter and not keep responding to the
posts then we need never be bothered by them again. Just a thought.

Derryck,

Not all of us use a nntp client that supports filters, and even if we did and used it, it only takes one person to respond, and then around we go again. I want to nip this one in the bud now, and besides spamming is plain wrong, just look at the division it causes in our already fragile community.

Coda.

That is true, but looking out the window does not tell me the forcast for the
rest of the week. Now I do not have to use the PC. Zweather solves that.

No problem here. I know the Hades was not made by Atari, but to me it is a
real Atari computer since it does have TOS as it's chipset. It is more close
to a TT than anything and still cannot run any Falcon programs.

That's not the point, i shouldn't have to be deleting commercial spam in a
non-commercial base.

I take your point about the traffic but i think the disease should be
eradicated not cured.

Hello Egon!!!

I just bought 6 16 MB 72 pin EDO simms from Coast to Coast Memory for 3 dollars a simm and FREE shipping. Where you located at?? This company is in New Jersey USA. Hope your state side to get a great deal like that. I found them on http://www.pricewatch.com and there phone number is 1-800-4memory Beyond that I think that is an awesome deal for anyone looking to upgrade there Atari computer.

I'm in the uk.

I have EDO simms by the handful, just no FPM simms at 16mb :(

Source record: 14142

This may be one of those "so sad, too bad" sort of things. The last version that ran on almost everything Atari was SL 2000. It is the last one that will run in TT high. Ulf is not using Atari machines to develop programs on, and using an emulator to let it run on a Pee Cee, he is doing development in Windows, and if it runs on an Atari, that is mostly chance or pure dumb luck. SL 2003 may load and run with a VME card giving a screen size larger than TT-High, but that is not intentional, as far as I know.

The version of Calipso for 2003 is supposed to do some new things, which make it a lot more worthwhile, in the way of editable text in PDF documents, but was not, as far as I know, necessarily intended to run on Atari machines. SL 2003 R1 would load and run, but not register, on my TTM 195, because support for this screen had been dropped several versions earlier, but the code in that area was not changed until 2003 R1.

By R3 it wouldn't even load in TT-High.

I do not miss Bridge. I get along just fine using TIFF output for shipping things to a printer.

Anyway, I think you can wave goodbye to the idea of Calamus running on an Atari.

The user experience on another platform was "Calamus virtually flies, but Windows is still Windows".

My expenses no longer include a couple hundred USD in upgrading Calamus every year, or every other year, since but not including 1.09. SL 2000 does everything I need it for.

Jim

1268. SCSI Hard Drives

Newsgroup: comp.sys.atari.st
Date: 2005-04-02 06:20:57 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <bPq3e.14955$wo1.12699@bignews6.bellsouth.net>
Source record: 14146

I'm getting ready to upgrade some SCSI hard drives on my Falcons.

I need 3.5 size and will be using them for D2D recording and for
help in Audio and Data CD creation.

Before I go out and spend money on a model I'm not sure about,
I was wondering if Falcon users and people in the know could
recommend some good Brands/models and type of SCSI would
be best. Like SCSI II,SCSI III, or just plain SCSI.

HD Driver and Cecile will be the Hard Drive System software
mostly likely used. I have 3 Falcons to upgrade drives on.
I also need a source for good SCSI cables to connect from the
Falcon to a Centronics type connection. I would rather have
cables of around 3-4 feet instead of 6+ foot in length.

I plan on using partitions close to a Gig each. So I guess I need
each drive to be around 10-15 Gigs.

It's been awhile since I've upgraded my drives. My last one
was a Toshiba 2.5IDE of around 6-8gigs on my CT2B.

The SCSI drives will be used on a fairly stock Falcon and
2 that are fairly modified with Bus upgrades and such.

I was wondering if there is any way to use the extra space on
a very large SCSI drive of say 100 Gigs with the limits that
TOS 4.04 has on a partition. IIRC, About a Gig a partition is
a far as ya can go with TOS 4.04.

Does anyone know if the CT2B Falcon upgrade using
Cecile from the Flash allows larger than 1 gig partitions
on IDE and or SCSI drives or are we stuck with the 1gig
limit.

Any help is appreciated,

phantomm@bellsouth.net

> Looks rather old. ;-) Thanks for the info though it was worth a try.

Thanks god, every little change in OS doesnt require new apps on Ataris as it does on Mac. Thats really a messy computer... We have TOS, Geneva, Magic, MiNT and basically all GEM and a lot of dirty apps runs nice. Almost all Mac apps use OS, but they still craps on new or old OS :)

Most Applications Crash, If Not The Operating System Hangs seems quite true :)

I have got a IDE Maxtor 60 Gb harddisk plugged by a Yamaha SCSI-IDE
converter. It's works fine on my Falcon.

> I was wondering if there is any way to use the extra space on

I heard, it's recommend to not use special software to expand 1Gb partition
for D2D work. I use several 1 Gb partition to work on TOS.

> Does anyone know if the CT2B Falcon upgrade using
> Cecile from the Flash allows larger than 1 gig partitions
> on IDE and or SCSI drives or are we stuck with the 1gig

The 1 Gb limit comes from TOS, Cecile manages higher harddisks (133 Gb max
on IDE).

But you can create very high partitions with Linux for example.

Sadly but true. Each new version Calamus is less compatible with
Atari. We can't blame Invers for that. They have all a family to feed
so they have to do something to get some money.
Ulf Dunkel told me once the next major Calamus release will not run on
Atari hardware at all even with MagiC.

The only reason why Calamus still runs more and the less on Atari
hardware is because it ask a tremendous work to adapt the Calamus code
so it can run natively on pc or Mac. Each version supports more and
more pc/Mac hardware and doing so becomes less compatible with Atari.
>

> I do not miss Bridge. I get along just fine using TIFF output for shipping
> things to a printer.

Bridge is for me a must have. I'm the editor of an aquaristic
periodical, which I make completely with Calamus. Before the final
release goes to the copy center I make a ps-file of it which I then
convert to pdf with Acrobat distiller. All the members of the
editiorial staff gets then a pdf file of the periodical for a final
revison. I use ps because the pdf output of Bridge is far too big.
>
> Anyway, I think you can wave goodbye to the idea of Calamus running on an
> Atari.

Sad but that is the truth. I only hope Invers will keep developing
Calamus SL. Even this is not quite sure. Almost all the man power of
Invers goes nowadays to Icalamus. This is a complet new dtp-program

which will run natively under Mac OS X. It will not support the Calamus
doc format (cdk) as we know right now, which mean one can't not read old
Calamus docs at all.
If this is a wise decision I surely doubt. For the moment there is a
very good dtp-program under development from Apple itself, called
Pages. It offers quite some good things. I doubt Invers will be able to
cope with this.
>
> The user experience on another platform was "Calamus virtually flies, but
> Windows is still Windows".

For the periodical I use Windows. I wished there was a Linux version of
Calamus. Calamus is the only reason why I use XP today. The periodical
Calamus doc is usualy between 30 and 60 MB. This is far to big to be
used comfortabely on the Hades. It takes ages before such docs are
loaded, etc ...
>
> My expenses no longer include a couple hundred USD in upgrading Calamus
> every year, or every other year, since but not including 1.09. SL 2000
> does everything I need it for.

I get every new update. Every new update is usualy better and give
more possibilities, but as said it also gets more and more away from
Atari

I wonder why you and others are so ancious to shut down Ben.

I agree what Ben does is some kind of spam but hell it's only a few
postings weekly/monthly.
You and others causes much more traffic with your replies then Ben
does with his messages.

Is it really so hard to deny his postings? That's what I do. I don't
need to set up filters and so one. I just use my common sence and deny
his post completely.

Also its a common pratice to reply beneath the originel message. This
way it's much more usuably to other users. But I guess that will fall
in death man ears too.

> Is it really so hard to deny his postings? That's what I do. I don't
> need to set up filters and so one. I just use my common sence and deny
> his post completely.

We shouldnt have to filter or deny anything, there are rules to protect us
from such eventualities.

> Also its a common pratice to reply beneath the originel message.

Common practise maybe, certainly not law, and if youre so bothered about
rules and regs then you try to shut Ben up as what he's doing is against
Usenet policy and IS a contravention

> This way it's much more usuably to other users. But I guess that will fall
> in death man ears too.

Did you learn that in retard school?

Well, after one week hardly fighting, the developper made it work with
my Falcon :-)
As read in other posts, it seems that using emulators make it harder to
make programs that run perfectly on all machines :-/
And, as Bridge behaves nearly the same way as Calipso...

Good night,

J.-Luc

1283. MagiC!, NVDI, GemSys & Co.

Newsgroup: comp.sys.atari.st
Date: 2005-04-02 20:26:33 UTC
From: "J.-Luc" <Myname.Mysurname@myisp>
Message-ID: <424efff8$0$3121$8fcfb975@news.wanadoo.fr>
Source record: 13960

Hello everyone,

When installing MagiC!, all is put "as is" into C:\GemSys, along with NVDI fonts and other system files.
As C:\ was near to run out of space, I decided to move some files to another place, and I didn't forget to change the paths in the many INF files, and all seemed OK. But, then, some features didn't work anymore.
For instance, I installed NVDI so as all its drivers were put into E:\GEMSYS, then I installed MagiC! into that same folder, and it copied all its files, plus an AUTO folder, into E:\GEMSYS.
Then, I noticed the keyboard wasn't correct anymore, in spite of the proper Keytabls.sys into E:\GEMSYS\XTENSION, and MagX-Net didn't work anymore too.
Then, I created a folder named SYSTEME on C:\, and moved MAGIC, OLGA, GEMDESK and THING into it, and changed all references to the paths into the INF files to match the new location... but still no correct keyboard nor MagX-Net working.
Then, I renamed C:\SYSTEME to C:\GEMSYS, moved all files (including NVDI ones) into it, changed all paths again, and then, all worked fine again.
So, in order to get a fully working system, I must let everything into C:\GEMSYS... or is there a way to do what I wish ?

Thanks,

J.-Luc

MagiC is hard-wired to refer to the partition you install it on AFAIK.

Would moving your folders to another partition and making symbolic
links (aliases) to them in the correct places on the C: drive work?

1285. Cat question

Newsgroup: comp.sys.atari.st
Date: 2005-04-02 21:54:37 UTC
From: Martin Nightowl Byttebier <geek@atarians.com>
Message-ID: <xwE3e.53432$bK3.3981360@phobos.telenet-ops.be>
Source record: 13962

Hello,

I wonder if Cat can handle User Authentication? You see my ISP demands
User Authentication to send out news messages. Although Newswatch can
handle UA it fails with my ISP. Therefore I was using until recently a
German free nntp-server (which also required UA but Newswatch had no
problem here) to send out message with Newswatch. Alas from 1 april on that
German nntp is no longer free.

The only Atari newsreader which is sofar able to send out message using
my ISP nntp-server is Troll.
To be honest I don't like Troll so much. I'm looking for an alternative.
Today I tried out Cat but ... it seems it fails to pass the UA.
I tried an Italian free nntp-server and my ISP's server. Both failed.

Is Cat unable to cope with UA or am I doing something wrong?

Hallo Martin!

MB>I wonder if Cat can handle User Authentication? You see my ISP demands
MB>User Authentication to send out news messages.

It should...

Have you entered your data in the NNTP section of the configuration dialogue of
in2cat? If so, what's printed in the in2cat logfile?

Please post the relevant portion of the logfile here, or better in
maus.tausch.cat.

If there are shortcomings, I'm sure Dimitri will be repairing it quickly :-)

With best regards
Ekkehard

1288. My Atari BBS is now online

I am working on a bbs for Atari users. If you have a telnet client, you can access my bbs at the following url: 24.57.167.178 port 23.

This system is still a work in progress and there's not a whole lot available yet. If you would like to login and follow my progress, you can do so with the following username & password:

username: guest
password: guest

Be sure to leave any suggestions and/or ideas, as this is the best time to do so; the bbs is still in the construction phase.

I'm working on adding the following:

- Usenet newsgroups
- File downloads
- Chat area for users
- Voting polls
- Online games

Pretty much standard stuff... Check it out.

Swe, swe... I've completely switched to Macs and I have not regretted
it at all. I will always be an Atari guy at heart but I just couldn't
take all the incompatibilities with all the dirty apps running bad. I
needed a modern computer that had "soul" that I could actually work
with. PCs do not have that. OS X Panther is a dream come true.

Joshua.

"The unforgiveable sins this earth must confront and overcome are
Nationalism, capitalism, and hoarding. The idea of every nation
should be forgot, price should be struck from the commons, and
princes should be seen for the devils they are. The sins include
our church, secret societies, and other religions which make of
the spirit of God a divide."

Last rites declaration of Ioannes Paulus PP. II (Karol Wojtyla)
2nd April 2005

--
the pains and perils to which they expose
themselves at court or in war, whence arise so many quarrels, passions, bold and often bad ventures, etc., I have discovered that all the unhappiness of men arises from one single fact, that they cannot stay quietly in their own chamber. A man who has enough to live on, if he knew how to stay with pleasure at home, would not leave it to go to sea or to besiege a town. A commission in the army would not be bought so dearly, but that it is found insufferable not to budge from the town; and men only seek conversation and entering games, because they cannot remain with pleasure at home.

But, on further consideration, when, after finding the cause of all our ills, I have sought to discover the reason of it, I have found that there is one very real reason, namely, the natural poverty of our feeble and mortal condition, so miserable that nothing can comfort us when we think of it closely.

Whatever condition we picture to ourselves, if we muster all the good things which it is possible to possess, royalty is the finest position in the world. Yet, when we imagine a king attended with every pleasure he can feel, if he be without diversion and be left to consider and reflect on what he is, this feeble happiness will not sustain him; he will necessarily fall into forebodings of dangers, of revolutions which may happen, and, finally, of death and inevitable disease; so that, if he be without what is called diversion, he is unhappy and more unhappy than the least of his subjects who plays and diverts himself.

Hence it comes that play and the society of women, war and high posts, are so sought after. Not that there is in fact any happiness in them, or that men imagine true bliss to consist in money won at play, or in the hare which they hunt; we would not take these as a gift. We do not seek that easy and peaceful lot which perm

I use a 1gb SCSI Jaz drive for CAF recording. They're fast enough, plus because they are removable cartridges (which are cheap these days) you can have as much storage as you want.

(Just dont try to low level format them.... ;-)

Coda.

First let me say, I've started all over again today with a brandnew
installation.
My major setup is freeMiNT 1.16.2 beta/XaAES/MiNT-net. With this setup
I really have a hard time to install Cat. The installation program
points to wrong dir. etc. ... but as I believe this is a XaAES fault I
won't go into details here (I will contact the XaAES author ASAP).
With freeMiNT 1.16.2 beta/N_AES 2.0.0/MiNT-net the installation
procedure went ok.

I tried once more with my ISP. The first problem occured already when
I wanted to retrieve the complete newsgroup list. I don't know howmany
groups my ISP supports (more then 13.000) but after some 2700
newsgroups the retrievement stopped and Cat imported the outfile.txt.
All the newsgroups I usualy reads were alas not in the imported list
.. I can't do anything (yet)

>
> Please post the relevant portion of the logfile here, or better in
> maus.tausch.cat.

maus.tausch.cat is not supported by my ISP. Anyway the language used in
Maus is German and eventhough I can read reasonable well German, I
can't write German.
>
> If there are shortcomings, I'm sure Dimitri will be repairing it quickly :-)

No doubt about that.
I'm not sure (and maybe I'm speaking pure nonsens now) but can it be
the problem I've right now (see log file) has something to do with the
speed of my internet connection?

I ask you this because Popwatch has a serious problem with my fast
connection. Downloading mails with attachement (>20 kB) is impossible

with Popwatch. I've had a chat about this with Erik Hï¿½ll and according to him it's because the downloading speed is to high for Popwatch. And indeed, the other day I was transferring a rather big file from my Linux box to my personal webpage. Whilst I was ftp'ing I launched Popwatch to get my mail. The retrievement speed was due the ftp'ing rather slow and to my surprise Popwatch mananged to get all my mails, even 1.5 Mb ones without any hazzle.

In the logfile below I altered my Username.
ps.: I haven't fill in the POP3 server as I don't want to download/delete my mails. Is there a way to tell Cat to let the mails on the server?

This is quite sad in this darn age. Why doesn't the author atleast offer
Paypal with a option to download the latest version?

I know a lot more people would buy HDDRIVER that live in the other parts of
the world if it was easier to purchase.

Tim

Not good :-(
Are you sure you've got the buffer size big enough in GlueSTiK's default.cfg?

MB>maus.tausch.cat is not supported by my ISP. Anyway the language used
MB>in Maus is German and eventhough I can read reasonable well German, I
MB>can't write German.

That doesn't matter. You may write in english there also.

MB>I ask you this because Popwatch has a serious problem with my fast
MB>connection. Downloading mails with attachement (>20 kB) is impossible
MB>with Popwatch.

This might be a buffer size issue also. But I can't tell mere, as I'm on
"narrow band" :-/

MB>ps.: I haven't fill in the POP3 server as I don't want to
MB>download/delete my mails. Is there a way to tell Cat to let the mails
MB>on the server?

Yes, there is. In Tausch/(Maus)Tausch-Kommandos, activate "Persï¿½nliche
Mitteilungen ansehen" and deactivate "Persï¿½nliche Mitteilungen anfordern".

I'll forward the NNTP part of the logfile to the Cat development group.
To try again, tick "sofort anfordern" in Tausch/Infodateien for the file YGA.

mit freundlichem Gruï¿½ aus Bubenreuth

Unless things have changed you should be aware that altho' Uwe owns the
software, Atari Workshop own the copyright to the English manual........

See inside the manual front cover.

I have one unregistered copy of v8.1 for sale.

Out in my area I have never actually seen a real life
falcon.. And only 3 TT's...

Always wanted a Falcon when they were new, to replace my
tired 4mb 1040, but back then my income didnt support
'cool', it supported 'need'. And due to the job, an IBM clone
qualifed as 'need', and damned they were expensive back
then.. (no PCditto wouldnt have cut it..)

I still have a TT but sold my falcon ages ago (stupid!)

I think i paid around £800 from system solutions? It was a long time ago and
i think i didn't eat for a year after spending that amount on an atari!

Hello,

It seems I managed to get it!
I first installed NVDI 5.01 to E:\GemSys, then installed MagiC! 6.20 to
E:\, updated to NVDI 5.03, and moved everything but NVDI components and
MagiC! drivers to C:\GemSys, then changed all paths to match this.
It all seems to work fine, except the first access to the lan lasts
many seconds (15~20), then everything goes as before.
Maybe something wrong into my MagXNet or STiK files?
Will try it on my FalCT60 (after I back it up ;-)

Have fun,

J.-Luc

I sent Uwe an email last week about paypal and this is what i received.

"I'm sorry, but I don't take paypal. You can pay by sending me 35 Euros in
cash, preferably in a registered letter. Please note that this price is only
valid in Europe, due to postage costs it's 37 Euros (or US $50) for sending
HDDRIVER to the US. Also note that I can only send you a German manual.
HDDRIVER with an English manual is available from Atari Workshop in the UK."

Thanks
David

1319. AtarICQ 0.164 released

Newsgroup: comp.sys.atari.st
Date: 2005-04-05 21:21:25 UTC
From: GokMasE <gokmase@gmail.com>
Message-ID: <1112736085.167751.20720@z14g2000cwz.googlegroups.com>
Source record: 13995

Hi all,

Time has come to release yet a new version of AtarICQ and as usual you can expect both a good amount of smaller fixes as well as some new additions.

The most appearant change is that you can now specify that aICQ sorts the contacts in your contact list in alphabetical order. Another visual change is the ability to remove the online/offline separators.

The routines dealing with buffering/logging of chat and system messages has been refined, curing a couple of glitches related to this. AtarICQ users talking to people using some ICQ clones may also be happy to hear that aICQ will now interpret also a single ascii-10 (lf) as a rowbreak.

Do give the new release a go, and don't hesitate to send feedback!

AtarICQ webpage: http://www.ataricq.org

Here is a more thorough list of things that are new or changed in 0.164:

* Made latest additions to colour settings in prefs/msg window/ work with colour selector
* Greyed out non-accessable entries in popup menus
* Improved unicode support (still truncates to 7 byte ascii for now)
* Make storing of unread encoded messages to disk work too
* Fixed the invisible "set away when idle" setting in preferences (A MagiC-only prob, due to its weird rendering of 3d-objects)
* Added possibility to remove the online/offline separators (For Ralph!)
* Make shell logging work for encoded messages
* Fixed glitch: No typing icon in contact list when online icon is disabled
* "Request authorization" is back in contact list popup menu
* Do not log (shell.log) old unread messages again, when they are reloaded from disk!
* When adding several contacts from server side list at a time, not all contacts info was retrieved. (Retrieving queue broken) Fixed now!
* Fixed problem with default colours not being adjusted for tab scheme
* Allow a single ascii 10 (lf) to trigger a row break (fixed probs with quirky icq clones)
* Alphabetical sorting of contacts is possible. Also note that contacts coming online/offline are reported into system message tab.
* No limit for number of tabs allowed (increase array size on the fly)
* Cured a bug which prevented status icon on a tab from being updated

properly if a contact in a non-active tab went offline.
* Worked around a bug in MagiC:s window (un)shading

+ Many smaller corrections and additions that were made along the
way...

Have fun!

Regards,

Joakim

Ditto. A "shortcut" is just to type "deja" since the groups used to be
under www.deja.com before google bought the company. I haven't used
newsgroup software in years.

1325. Looking for a monochrome PD breakout/arkanoid game

Newsgroup: comp.sys.atari.st
Date: 2005-04-06 07:30:23 UTC
From: Toby <google@asktoby.com>
Message-ID: <slrnd5740f.u3f.google@ID-171443.user.uni-berlin.de>
Source record: 13902

Back in the 90s I used to have a game on my Atari ST that I am now
trying to find again.

It was a breakout/arkanoid clone, but it was monochrome (high-res).

It was a public domain game.

I thought it was called Super Breakout, but that seems to have been a
colour game.

I've looked on "Little Green Desktop" but don't see it there.

Anybody remember this one?

There is only a german hypertext available.
If anyone interested to translate the hypertext from german to english I
can send you the source of the german hypertext.

Ciao, Bernd

Let me give more details... The game was very imaginative, lots of
different block-types (invisible, moving, teleporting etc), it had a
level editor, and I think the screen was laid out a lot like this but
monochrome:
http://www.ntrautanen.fi/marko/sao/pelilistat/images/atari_st/super_breakout.gif
The background was white, not black.

Still sound the same? I don't recognise the name, to be honest!

I remember I bought it from a PD catalogue, a little A5 booklet that
looked like it was home-printed in a DTP package, we used to get sent
them periodically and they had 1000s of PD software in them that you
could buy.

I have not managed to get it to work reliably on my TT with a disk larger
than 1G Byte. Nor can I get it to work with the Anodyne drivers for the SCSI
Ethernet interface. (Even HD Driver 8.xx fails with these, only 7.9x works).
However my German is poor (I keep trying to improve) so I may be doing
something silly.....

1333. CompactFlash "hard drive" issues resolved yet?

Newsgroup: comp.sys.atari.st
Date: 2005-04-06 14:52:02 UTC
From: Hallvard Tangeraas <inv@lid.email>
Message-ID: <4253f78f$1@news.broadpark.no>
Source record: 13908

I've read and discussed with great interest the whole CompactFlash thing, where this type of memory card is used to replace a (noisy) mechanical standard hard drive connected to the ST/STe.

Having been set straight (thanks "Atarian1") regarding the actual costs (yes, I have been living in a cave apparently ;-) ..... it most definitely sounds like a solution for me, wanting a virtually silent computer (I'm in the midst of a project where I'm going to place an ST inside a 19" rack enclosure with all the bits and pieces inside, instead of hanging out with wires all over the place).

I've been reading some more about the subject, and it appears that some people are having problems with these memory cards and Ataris. In the thread "Booting from SCSI card reader" (http://groups-beta.google.com/group/comp.sys.atari.st/browse_frm/thread/7844bff96cd6088a/9b61d3bd12e0fa0d?q=compactflash&rnum=4#9b61d3bd12e0fa0d)

where "PuffPuffin" says that he can't boot from it.
The other issue he has is when he removes one card and replaces it with another he can't read either card.

The latter really won't be an issue for me, because the CompactFlash card will be a permanent drive, as a replacement for a "normal" SCSI hard drive. I will get a 512 MB or 1 GB card, which should be more than enough. Everything will reside inside the 19" rack enclosure, so no card-slots or anything.

So my question is: are there still unresolved issues like these around? I didn't find any replies with solutions to his questions.

For me, to have Compactflash as a replacement for a hard drive it has to actually work like a hard drive, meaning that for one it has to boot. Inserting a floppy with a hard driver in every time I turn on the computer isn't an option.

So has anyone got all of this working, and working well, as a complete and full replacement for a regular hard drive?

Message-ID: <1112802697.205336.306250@g14g2000cwa.googlegroups.com>
Source record: 13910

Hallvard,

That was probably not the best thread to bring back up ;-)

The latest thread on this subject was:
http://groups-beta.google.com/group/comp.sys.atari.st/browse_frm/thread/fa02e27aefedaa26/ccba59d24771933c?q=compact+flash&rnum=1#ccba59d24771933c

Anyway,

I decided that it would be good to try a SCSI to IDE bridge and an IDE CF adapter rather than a SCSI CF reader. So I ordered one off ebay, and tested it in my Stacy (http://www.janthomas.org.uk/ goto other projects / Stacy) with a 10gb IDE drive, which worked great. I also ordered a 512mb CF card (Viking branded but its a Toshiba card) which I have got, and an IDE to CF adapter which hasnt arrived yet.

Im hoping that the IDE to CF system will work, at which point I will order another bridge/CF adapter/CF card for the Stacy as I want this one to go in the TT.

Coda.

I have a monochrome Hi-res version of Super Breakout, and used to play it a lot. It has all the features you described in your follow-up email including a level editor. I will try and find the disk it is on, although I have no way of playing it. But for sure, it is definitely hi-res!

AHDI works fine for smaller drives. Larger drives only seem to work with
HDDRIVER.
I only have demo at present so formatting/partitioning presents some
problems

> BTW are you "up north", g8mqw rings a bell for some reason....

Perhaps that's TT specific behaviour?
I have a 2.1gb IBM on an STfm with CBHD, running fine.

>> BTW are you "up north", g8mqw rings a bell for some reason....

Ok, I'll see if that free Italian nntp-server supports maus.tausch.cat

Hmm, indeed that server supports that group but it seems the server is
unreachable for the moment.

Not quite sure, but I think Erik Hï¿½ll has implemented a special thing
in Mymail to prevent such things.
It has something to do with the CNbyte_count() call to sometimes
returns such large numbers that the program treats the number of bytes
as an error.

I hadn't seen that one, but read it now.
So are you the original poster (Brian J. Roland)? The original poster mentions using a STacy as well.

> I decided that it would be good to try a SCSI to IDE bridge and an IDE
> CF adapter rather than a SCSI CF reader.

But this is because the SCSI interface within the STacy doesn't fully comply with normal SCSI standards, isn't it?
I have a Link 97 as well as an IDE Link 2. As far as I've been told the Link 97 is supposed to comply with modern SCSI standards, so I presume an SCSI card-reader would work fine in this case, right?

Are you sure of that ? Banks I've asked last year in France still
charged something like 10 euros for a cheque (in euros !) from another
country.

I've sent cash to Uwe (though it's illegal in France), and had the
software that works great. But the German manual is a real pain though...

And they also charge ï¿½14 here to do a transfer, something I have been
told was 'free' by a German Apple specialist whom I offered to pay by
PayPal for some Transwarp upgrades, accepts PayPal from US customers,
and wanted a bank transfer.

Which of course resulted in me simply not ordering the parts, again,
which I actually really need for my IIgs.

>Are you referring to gluestik? That will allow most sting clients
work on
>mint-net without installing sting and the messy cpx modules related to
it.

No...not gluestik.
This piece of code replaced the CPX modules that setup and control
STiNG.

With any of the later kernels that support VFAT along side N.AES 2.00,
Geneva, or XAAES all three...using every CPX loader I know of (X, Z,
Cops, Freedom, etc...) I see all sorts of errors as soon as that main
STing CPX is enabled.

Wether it's the CPX itself, the SCSI-Ethernet STX or something deeper
down inside STing, it's hard to say.

I'd read something somewhere about a little prg to bypass the CPXes and
enable STing, but have never actually found it.

Your best bet would probably be to turn the hyp to plain text using
hyp2text, wrap the result in html tags to make it html, whack it up to
your web space and then use Google, Babelfish, Systran etc etc etc to
translate to English.

Hallvard,

Im not Brian Roland, im Coda/Smeg/JT depending on what time period in history youre looking at. I didnt mean to start a fight with Uwe at the time, so I was a little embarrassed.

Ok, on with the subject at hand... I just felt that perhaps some of these scsi-pcmcia adapters were not working as planned for some guys, so I thought i'd try an alternative. We know that the Stacy and MegaSTe host adapter is weird, AFAIK it only supports the SCSI1 command set, however if the IDE bridge can respond to the SCSI commands that are sent to it in a proper manner then you have a cleaner path (maybe) from the ide device to the ACSI bus. CF is supposed to be compatible with IDE, it just needs a different connector, which is why these IDE=>CF adapters have no IC's on them. On the other hand PCMCIA to CF adapters are similar, they only convert the pins, theres no electronics involved, so the difference must be in the actual device that provides the bridge, whether its SCSI=>IDE, or SCSI=>PCMCIA.

Coda.

I've an "Imagine" ET4000 VME card in my TT. I also have NVDI 5. As far as I know, NVDI 5 has drivers for ET4000. Unfortunately both NVDI and Imagnine documentations are in German (the language I doesn't speak).

Can someone guide me how to install NVDI with my VME card? What is the auto sort order? Do I need all the files that are put in the auto folder by my VME card installer (menu.prg, emulator.prg, sta_vdi.prg)? Or some of them must be replaced by NVDI drivers?

Any help is very appreciated.

>
> Thanks for any information on this matter,

Well...

1> You read the temperature of the room before to put the power on the
falcon, it's important.
2> You put the power, and you read quickly the temperature od the 060.
3> You get the difference, for example if you have 30ï¿½C on the 060 and
20ï¿½C inside the room you get -10.
4> You divide the result by 2.8, so for my example you get -3.
5> You put this offset value inside the CPX and press OK.
6> Now you can read a good value for the temperature ;-)

The TLV converter has a +/- 2.8ï¿½C of precision and the 060 10ï¿½C, so you
can fix 15ï¿½C easily. Another problem is the noise of the measure, the
CPX get an average value of the latest 8 measures.

Regards,

Didier.

the gf made a funny about this the other day, I built her a new PC and it has a read out on the motherboard, she thought it looked pretty, so I asked her does she actually know what its for ? and she shocked me and said "yeah it tells the tempreature of the PC" well I was shocked cos its the first thing shes got right in 6 years, so I asked how the hell do you know that ? and she said "becasue the other day it said -1" (it was very very cold that week....._

Well I thought it was funny, I guess you would have had to have been there :P

Is there a way to not request New Groups?

It seems impossible to change YGN in Swap/info files.

Anyway this is a new log

Just last year I was trying (hard) to purchase software from Woller
Systems in Germany. They don't accept credit cards, no personal check
(because of a charge) and I finally ended up using Western Union to send
cash directly into somebodys' bank account that works there. Not pretty
but it did work although I'd have to say its still expensive and too much
work for someone in the US. :-(

I did finally manage to get N.AES on CD like this though.

These are different files.
Your HYP file is surely the HYP file from Fritz 5.23.

My STG file is from the newer Fritz 5.30ï¿½ version.
There are many difference between Fritz 5.23 and Fritz 5.30
Fritz 5.30 for example is easyer to configure.

Oh no. This is a poor method to translate a text.

Ciao, Bernd

Yes, I have a Mega STe too, and the SCSI host adapter in it is a bit
limited.
But I also have a Link 97, which I hear *is not* limited in that way, so
I'm still interested to hear if a CompactFlash card will work flawlessly
with it in every way, so that in the end it'll act just like any normal
Atari hard drive.

One note about this little app:
Before I started using MiNTnet, I used STiNG with this devset.prg. I liked
it because it simplified my setup. But be careful when editing the devset
configuration file. It is not read correctly if you use SPACES where real
TABS must be used. I remember it took me ages to find that out.

I cannot imagine that happening. I am not thrilled that the Atari version only runs in 256 colors and 32bit. That means if you do not have an Atari machine with a good graphics card, then you will have to settle with 256 colors. I will keep getting my updates as long as the support is there. Let's hope that is a long time.

I use a little program that goes into Magic's Start folder. It allows you to choose which country style you want the keyboard to use. I choose the US and I get an American flag in my upper right corner. Great program. Email me if you want it.

Hi I'm looking for a program called SCSITEST. It's mentioned on the Czuba tech website and in the CT1 instructions. I have a couple of Falcons I want to check out, and I understand this program will test the SCSI bus and drive(s) and maybe the bus-fix situation.
I've been in touch with Rodolphe Czuba and he no longer has it.

Can anyone tell me where to find it?

Regards Mark.

Very interesting thread. I also enjoy the silent Atari ST, and the noisy
SCSI drive bores me...
Do you have an idea where a SCSI compactflash card reader could be sold
today? I've made a (quick I amdit) search on Google and found nothing...

Cheers
Simon

There were (are?) some made by Microtech that I know others are using
with success at least with a Hades. I have tried their triple card
reader with no success, and haven't been able to get it to work. I
understand that the PCD-25BH has been used with success (the dual
PCMCIA model). I'm still looking for one of those. I think I will
find that it may work with my Falcon (true SCSI) but I don't think
this is going to work on an ST without a Link '97. I have a Link II,
and I understand that it does not implement all of the needed SCSI
specifications. The triple card reader that I have shows up on my
Falcon, but it says the media is write protected when I try to
partition with HDDriver. The triple card reader seems readily
available most the time on eBay.

But it may work *with* a Link 97 then?
The key word being *might* perhaps.....
I don't feel much like forking out the cash, time and effort trying to
get hold of the needed hardware only to find out that it won't work
after all.

> I have a Link II,
> and I understand that it does not implement all of the needed SCSI
> specifications.

I bought my Link 97 second-hand, so I'm missing the specs. But I bought
it because people at the time told me that it would be compatible with
"everything". That's a few years back now, so I would be interested in
finding the exact specs for this host-adapter.
Are there any other Link 97 owners out there who has a manual or whatever?
Hopefully it'll work with current SCSI devices as well.

> The triple card reader that I have shows up on my

Bummer. I don't have a Falcon myself, but since it's at least recognized
there must be some way of working it out.

I've been continuing my web-searches, and although I haven't found much
in regards to SCSI compactflash card-readers, there are some useful hits:

- Microtech PCD-47B (triple card internal SCSI reader)
Yup, like you said, available at ebay. I found one which is currently at
US$ 0.99 (5 days left):
http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=56082&item=5183904744&rd=1&ssPageName=WDVW

- Kodak SCSI compactflash card reader
I found this at Amazon for US$ 49.95, but have no idea if it's suitable
or not:

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&category=56082&item=5183904744&rd=1&ssPageName=WDVW

- Microtech PCD-40 (portable SCSI card-reader).
This one is expensive, going for between US$ 170 and 200. One place to find it is at Amazon:
http://www.amazon.com/exec/obidos/ASIN/B00006BAYJ/ref=nosim/elisecom/104-8273747-8828744?SubscriptionId=09FVDRT8TEJ64C2A7Y02

-Microtech DPAI (Digital Photo Album Internal -dual slot card reader)
which is, according to this website:
http://www.bright.net/~gfabasic/html/about_me.htm
just a different name for the PCD-25BH which you mentioned, which people have had success with.
Hey, hold on!!!!!! Upon reading a bit more in detail, this page belongs to Lonny Pursell -an Atari user, and he lists those devices connected to a Hades and a TT, but since he's also got regular hard drives in those machines I doubt he's using the compactflash cards as hard drives, but I may be wrong of course.

Some more links for the card-reader:

http://www.steves-digicams.com/microtech_dpai_scsi.html
(review/user-comments)

http://www.d-store.com/d-store/microtech/Microtech_Store.htm
(unfortunately no price available)

http://www.ordersite.com/canadaram/usbaccessories.html (scroll down to "memory card adaptors" and you'll find the PC version for Canadian $ 426!!!! Ouch!!! That's got to be overpriced.

http://www.shopping.com/xPP-Input_Adapters--pc_card_reader (they have the DPAI card-reader shown, but they also write that it's no longer available, and no price is shown, but you get a picture of it).

http://www.epinions.com/Microtech_PhotoAlbum_SCSI_PCMCIA_Reader_Writer__PC___Flash_RAM_Storage_DPAI_SCSI_PC/display_~full_specs
(Here are some specs and comments along with a photo, but still no price)

http://www.computersplusnyc.com/productfind/searchname.asp?&req=1&manf=MICROTECH_INTERNATIONAL
(Microtech card reader listings and prices, as follows:
PCD-25BHSF READER SCSI2 SLOT INTERNAL TYPE3 SMARTMEDIA SM US$207.39
(this sounds like the internal dual-slot one we're looking for)
PCD-25SF-PC EXT SCSI DUAL SLOT READER/WRITER FOR PC SMARTMEDIA US$248.87
PCD-25SF-MAC EXT SCSI DUAL SLOT READER/WRITER FOR MAC SMARTMEDIA SM US$248.87

So.... the conclusion so far is that the dual-slot reader from Microtech is hard to find and expensive when found.
But who knows, searching in used computer hardware forums, garage sales, swap meets or whatever might yield better results.

Another idea springs to mind.... seeing how cheap USB card-readers are (typically around US$ 20-30 if I recall correctly), what if there were USB to SCSI converters around (that aren't too expensive)?!
I've found a converter which goes the other way round, from Microtech again (http://www.qbik.ch/usb/devices/showdev.php?id=195), but that really doesn't help us.

OK, I've done my fair share of investigating -perhaps someone else has some new input on the subject.

Hehe... it's funny that you've posted here, because I just wrote about
your site in a followup here ;-)
The above link didn't seem to work -just a blank page with a blank
photo-frame.

So my assumption was correct: you're not using the card-readers for a
replacement hard drive, resulting in a silent (apart from the fan) computer?
Do you have any blank compactflash cards which you could use to try it out?

May I ask how much you paid for the card-reader?

I am looking for a DMA cable to hook up a Megafile 30 to my ST.

Either the cable, or a couple male db-19 connectors so that I
could make one myself (impossible to find those locally).

I'm in eastern Canada.

Michael

1380. CompactFlash "hard drive" issues

Hi ST addicts.

I once had a Link97 connected to my 1st gen ST.
It worked with anything i could put a SCSI 50 pins cable inside. I
miss it. Is it sold anymore?

However, since the Lin97 was meant to work externally, are there any
alternatives to the internal Atari ACSI - SCSI converter from the Mega
STe/STacy (which only recognizes pre 1988 drives)? That is - it has to
be mounted inside the Atari.

I am going to try the CF experiment using a Spyrus PCMCIA cardbus >
SCSI converter. I will let you know about my progress.

Not that I know of. Perhaps someone else knows better.
I think your best bet is to look for a second hand one.
A suggestion would be NOT to look around in the obvious places (i.e.
this newsgroup) but rather where *non* Atari enthusiasts might dump
their gear. I'm sure there are lots of ex-Atari users out there who see
no value in their gear and "throw" it away for next to nothing (or in
some cases literally nothing! I got an unused Atari SM-144 monitor for
free some years ago!!!! I asked around in a general computing newsgroup
for buying an Atari monochrome monitor and someone who was dumping their
gear replied).

> However, since the Lin97 was meant to work externally, are there any

Yes, I believe there was an internal version.
Just do a google-search for: intern "link 97" atari
Or if you're not bothered, just click on this link:
http://www.google.no/search?q=intern+%22link+97%22+atari

> I am going to try the CF experiment using a Spyrus PCMCIA cardbus >
> SCSI converter. I will let you know about my progress.

Excellent. Looking forward to hearing about your results.

Hi Simon,

S>Banks I've asked last year in France still charged something like 10
S>euros for a cheque (in euros !) from another country.
I think that the ECB changed the tariff of cheques so inside the Euro zone so it doesn't matter if a cheque is drawn (?) inside Germany or from France to Germany. But 10 Euro (if true) would IMHO be too much.

S>But the German manual is a real pain though...
that may be right, but I regard HDDRUTIL as mostly self-explaining.

So don't be too desperate. You may put your questions here, and if I'm able to answer them, I'll do so.

And the german manual still is here with my Atari books my recent driver version being 8.12.

Und TTschï¿½

* Gruppe: comp.sys.atari.st
* Name: Martin "Nightowl" Byttebier

MB>The installation program points to wrong dir. etc. ... but as I
MB>believe this is a XaAES fault

The problem with the installation program is, that it is used so seldom. And mainly by new users. And since there are only few new users, there are only verry few bug reports for install. So I am usualy busy with cat, in2cat,...

MB>I don't know howmany groups my ISP supports (more then 13.000)

That should not be a problem, news.online.de has some 36000 or so. Try to use this one, if you have the same problems there we know that it is not because of the nntp-server

MB>I'm not sure (and maybe I'm speaking pure nonsens now) but can it be
MB>the problem I've right now (see log file) has something to do with the
MB>speed of my internet connection?

There are some timeouts, but that would be a problem with very slow connections, I don't see how a fast connection could be a problem, I'am using DSL 2000. But on a PC with MagicPC

MB>1978184: Server: Fehler bei recv:SMTP412 ;Handle:2; size:100000

This should be NNTP412, but in2Cat uses the same routines for SMTP and NNTP. But 412 is no Answer to NEWGROUPS according to the RFC, but I suppose, that it means, that there are no new groups, wich would be understandable, since you ask for new groups after 050404 185720 witch was only 1h before you wrote that mail.
So you need to order a complete list (YGA) as Ekkehard already told you

Some of the other error-codes Ekkehard forewardet to me were also not included in the rfc. So there is something strange with that nntp-server. So either you try an other one, or if yours is free, tell me the url and I can try it from here.

They ship USPS for small items, that can't be $20 to Canada can it??

I got it to work now. The problem was that the long URL was split up in
two lines, but with a little cut and paste I worked it out.
Looks like an external single-slot model.
I thought you had the internal one.

Which one exactly is this? Which model number?

>> Do you have any blank compactflash cards which you could use to try it out?

>
> I have 4 dual units, all identical and the one external single slot reader.
> Paid anywhere from $26 to $100 USD. Ebay of course.

You're referring to the Microtech PCD-25BHSF DPAI (dual slot, internal,
SCSI card-reader)? I'm getting a little confused about all the model
numbers and versions.
I assume the "PCD-25SF-PC" and "PCD-25SF-MAC" models are just the
external versions of the same card-reader?

No such device is to be found at ebay (or anywhere else for that matter)
at the moment.

> I also tried one of those triple card reads, and like Joe had no luck with

> Not sure, but the hades for sure didn't see these drives on the IDE bus.

Bummer :-(
But as long as something works we can settle for that and forget about
the rest. Too bad the PCD-25 models are so hard to find.
I'm trying to look for one locally as well.

I've never used a Hades, but I assume that if these card-readers work
with it, they'll also work with a regular ST/STe/Mega STe etc. with a
Link 97 and HDdriver (that's the driver software you used, right?) If
so, which version of HDdriver?

So they all worked fine as "hard drives" then?
You were able to boot from them without any problems and use them just
as any regular hard drive?

On my system I'm not going to have a normal hard drive at all if this
works, as I need a *silent* system, which is the reason I'm looking into
this in the first place.

I didn't realize that other types of cards could be used as well as
there's only been talk of CompactFlash cards. Price and
performance-wise, are CompactFlash cards the best alternative for
harddisk replacements (i.e. daily use, lots of reading/writing of data)?
I'm thinking that either a 512 Mbyte or 1 Gbyte card will do.

> They ship USPS for small items, that can't be $20 to Canada can it??

I selected "UPS Canada Ground Standard", which is their only option
available for shiping to Canada (all others are US only), and it gives
me this on my order:
- Order Subtotal: $1.70
- UPS Gnd to Canada Shipping: $17.75
* Grand Total: $19.45

That's more than the price of the complete cable at Best Electronic, but
then again BE won't ship for any less than $20 worth of good, and there is
shipment cost on top of that.

Sleep time again for my Megafile :(

I have found two disks with monochrome games on them, but my PC won't read
either disk - probably an exotic format. I'll drag an Atari out of the
attic this week and see what I can do.

What a guy!

However, PCs should be able to read atari disks - maybe they have become
demagnetised.

No, thank-you, that's not what I wished. But I think I succeeded in
what I wished to do : I reinstalled both NVDI & MagiC! on both my TT
and one of my Falcons, and (at least on the TT), it seems much more
stable. On the Falcon's side, I think it's a problem with components
versions (it's CT60'ed, so I must bee very carefull not to mix parts
for 060 and ones made for 030).

Good evening,

ECB didn't change anything : if I (from France) send you a cheque to
you (Germany), your bank will charge mine a fee that mine will charge
me, after havind added their own fee.
So, it isn't worth using cheques for payments less than 200 euros (the
fee actually is 10 euros).

Not an issue for me. In fact, the computer as well as the card-reader
and everything else will be inside a 19" rack enclosure in the end, so
if I would ever need to chance a CF card I'd have to open it up.

>> I didn't realize that other types of cards could be used as well as

Fortunately CF cards can go way beyond that. I believe I've heard of 4
GB cards, which is many, many times more than any of us Atari users will
ever dream of needing in my opinion.

> You can use many types of media so long as there is an adapter for it. Most

I've been discussing CF cards used in the place of hard drives in
another group, and I was told that when it comes to their lifetime,
there's just about no limitation to how many times they can be read
from, but writing to is limited to something like 10 000 times. Sounds
like a lot, but imagine how many times the drive is written to under
normal, daily use. Bummer!
I'm suddenly not sure if CF is the way to go after all.... :-(

When I click on your site listing, A dialog
box entitiled : Log On As pops up

Here is the contents of the box:

Either the server does not allow anonymous
logins or the e-mail address was not accepted.

FTP server : landover.no-ip.com

User name : _____

Pasword : _____

After you log on, you can add this server
to your Favorites and return to it easily.

! FTP does not encrypt or encode passwords or data before
sending them to the server. To protect the security of
your passwords and data, use Web Folders (WebDAV) instead.

Learn more about using Web Folders

___ Log on anonymously ___ Save password

_____ _____
Log On Cancel
_____ _____

When I Log on anonymously, this same dialog box pops up again.

Is this what is supposed to happen?

I believe it's a fault of XaAES. I haven't talk to the developer yet.
>

I've setup Cat with a free newsserver. No problems to retrieve the
complet list. I even could get the messages from the groups I
subscribed too. Alas today I don't get the new messages from the
subscribed groups.
Posting to newsgroup using Cat and the free server doesn't work at
all. That's why I'm using Troll. With Troll I can get new messages and
post messages with no problem whatsoever.

>

I'm using cable and I'm pretty sure Popwatch has problems with the
speed of the connection. Retrieving mails above 20 kB doesn't work.
The other day I was uploading a big file to my public webspace.
Because of this action the download speed was slower and guess what?
Popwatch could retrieve several 1+ MB mails without problem but as

soon as the speed was normal ... it was impossible again.
>
> MB>1978184: Server: Fehler bei recv:SMTP412 ;Handle:2; size:100000

> here.

I'm using a free newsserver right now. Getting the complete list is no
problem. I managed once to get the articles from the newsgroups I
subscribe too but as today I don't get the new articles.
Am I dong something wrong? I really don't know. YGB is ticked so to my
understanding I should get the new messages if I launch the terminal.

Posting using that free server doesn't work at all. With Troll or with
Linux newsreaders posting works just great.

BTW: The free server supports maus.tausch.cat so if you wish I can
write to that group (in English).

I just donated the following items to Goodwill in Mesa (near Fiesta Mall):

* 1040ST
* SC1224 monitor
* Atari mouse
* 520STfm
* SC1224 monitor
* trackball
* 20MB hard drive (homebrew)
* Microcube flight controller
* External floppy drive
* internal floppy drive
* Magic Sac+ cartridge
* 2 boxes full of games, applications, and documentation

The computers, monitors, and hard drive all work fine. Much of the software is in original packaging, including: Degas Elite, Paperboy, Seastalker, Microprose Flight Simulator. The hard drive is loaded with software, but I've not gone through to catalog it. Also, I haven't looked to see what's on the extra floppy disks. (2 disk bins full of floppies.)

Items donated to Goodwill on Monday, 4/11/2005.

Hello Lance, while it's nice of you to make the collection available,
is there any alternative method that you have that can be used to
obtain the whole collection, with your stated 100 files per day
limitation it would take 600 days to download all the files.

Using something like bit torrent would be more suitable. I've not
managed to download anything yet from your server as it drops the
connection when I try to start a download, even if I've successfully
logged in.

Cheers!

Great. if you do then let us know, I've been seeding the complete MAME romset for about a week now and will happily add your archive to the list. People are currently dragging about 12k/s out of my link downloading it from me. A line upgrade is happening in a few days.

The best way to do it appears to be to share out the directory heirarchy rather than archive it all into one large zip file as this allows people to check out the contents of the download as it comes down and also to copy a partial dump from one person to another then for those two people to hit the torrent and continue from where the download left off. Also if they delete one file they just hit the torrent again and just that one file is downloaded.

Sorry if you already know all this ;-)

I've been discussing CF cards used in the place of hard drives in another group, and I was told that when it comes to their lifetime, there's just about no limitation to how many times they can be read from, but writing to is limited to something like 10 000 times. Sounds like a lot, but imagine how many times the drive is written to under normal, daily use. Bummer!
I'm suddenly not sure if CF is the way to go after all.... :-(

- - - - -

I'd like to remind you that 10,000 rewrites is far better than you would find on floppy disks, which many of us remember once using as our ONLY means of data storage. Although most of us have become used to our extremely stable hard drives, one can adapt. Simply backup your drive regularly (I back up documents to floppy when I work with them and the entire drive to CD-R every three months) and replace the CF card every couple of years and you should be fine. If you use another media for documents and caches, your CF card should last a decade or more.

Better to use them carefully, but....been there, done that, and after
about 20 years, some memory of that general type is still working in
M1 family of US tanks, even though it was guaranteed for only 10,000
writes. It appears that the manufacturer is willing to guarantee only
10,000 writes because testing production for more than 10,000 write
cycles takes too long, and that such things will last for quite a bit
more than 10,000 write cycles. Of course, with determination, you can
wear one out pretty quickly, but in normal use, it will last close
enough to forever.

Started it - the torrent page (complete with forums) is at
http://landover.no-ip.com/pods/index.php

Only just starting to seed now on a per directory basis, so it's slow work,
but once all of 'em are here, I'll swap over to torrents only.

Great, a lot of effort went into that from the look of it! I've just started trying to grab the Atari stuff.

I noticed you split the archive up into lots of little torrents, I'd have thought it would reduce your bandwidth load if you'd made a few large torrents as there's then a greater chance of people downloading the same thing at the same time (and therefore downloading off each other rather than you). It would also make it easier for you to admin! If I'm right on that (I'm not 100% sure), it might be worth considering making later torrents larger.

Cheers for the archive though, looks very valuable!

I had originally thought to do each section as one very large archive, but
decided to do the individual directories - that way people who only want one
thing aren't forced to wade through thousands of files (just wait until I
put up the 20,000 or so C64 games & you'll see what I mean).

cheers,

Lance

Especially since, with Azureus as a Torrent Client, you can select what
to download and what not to download in a large torrent,

My 2 cents worth

Jeremy

Well some of these torrents are still in excess of 20 megabytes, so they
ain't that little!

cheers,

Lance

1437. CFN to TTF converter

Newsgroup: comp.sys.atari.st
Date: 2005-04-13 22:37:17 UTC
From: xlator@cix.compulink.co.uk
Message-ID: <od2dnZeKQ4CAAsDfRVnyiA@pipex.net>
Source record: 13814

I had a program that converted PD CFN/Calamus fonts to TTFs on an Atari. But I'm blowed if I can locate it :-(

Can anyone tell me the name of the file I need? (I think it was a TTP, but am not sure).

Regards, /Peter/

Calamus SL (with the font tool module) is able to do that for you.
Calamus can import ttf and postscript and convert then to cfn with
ease.

Don't know a TTF->CFN, though Fonty contains a PFB (Postscript font) to CFN (Calmus font) converter PFB2CFN.PRG. And of course Calamus itself can load TTF fonts and convert them to CFNs with the Font module.

Well, maybe obsolete information, although I suspect the author still has
the same name and phone number,

Don Turnock
MegaType
P.O. Box 645
South Bend, IN 46624
(219) 288-7468

Two of his programs I have. One converts TTF or PFB to ECF, and the other
converts ECF to CFN or PGS.

The third is FontEditor, which I do not have, which converts ECF to PFB.

I think I got the very last of his programs about the time that Toad
Computers went belly up.

Jim

Toad Computers...man, the money I spent there! I know its off topic but
anyone know what they are doing these days? I've got one of Daves' old
Mega STe keyboards that he auctioned off not too long ago.

Sure do miss some of the "old" crowd.. :-)

Go to www.toad.net and look around. I actually emailed Dave about 18 months ago to get permission to scan his old catalogs. He seems to be doing fine, and last I heard was still married to Jennifer.

Don Turnock is still around. He lives about 2 miles from me. However he is not into Atari computers anymore. One of the guys from my Atari club gave him his Falcon and he has not seen it since. Too bad. The guy is a genius when it comes to computers. I still have a setup he did for me that has a hard drive and two disk drives in it that is all in a case along with a power supply for a ST. The number should be correct, because I do not think he has moved. He put together my wife's PC and she said he lived in some old houe in South Bend and that is what I remember when I went over to see him from time to time.

A friend of mine is looking for an AtariST-Falcon program
that helps to teach Guitar playing.

I remember at least one that was sold by Systems For Tommorrow
or Chromagic. But I forgot the name of it.

Anyhow, Would like to get a complete original of it or a similar
program thats good for beginners to advance.

Also looking for Digital Home Studio and the Data CD.

E-mail me if have info,

phantomm@bellsouth.net

Edward,
So you have used the Link II with a compact flash device?? If so,
which device?

Source record: 13835

I'm sure this subject has been covered before.

But I missed it......

I need to replace a couple of Atari Falcon internal Disk Drives.

Are there replacement models that I can ask for which will work
correctly
with all software, copying, formatting and etc without having to make a
modification.

If so, I'd appreciate the Brand(s) and Model numbers to ask for.

Also, For my own reasons, I rather not have to ask any Previous
Atari Dealers in CA for them unless I have no choice.

Thanks for any help.

phantomm@bellsouth.net

1459. Highwire

Newsgroup: comp.sys.atari.st
Date: 2005-04-17 04:07:05 UTC
From: jdplace@REMOVESPAMcableone.net
Message-ID: <1163o796f0e1r17@corp.supernews.com>
Source record: 13836

I'm very impressed with the progress that has been made with Highwire. I'm curious: Is it likely that Highwire (or any browser for Atari ST/TT/Falcon will mature to the point where Javascript is implemented and security is such that one can use things like eBay, Paypal, etc? I have a CT60 Falcon, and if I could use it for these activities I would no longer need the Mac that I keep next to it for browsing certain websites. The main reason I ask this question is that I would like to plan ahead. There are some software items that I would purchase for my Falcon if I knew it could eventually meet all of my needs. Right now I hesitate to spend the money when I have another computer that can take care of these things. Hopefully this will open up some interesting discussion.

Any 2,5" will work, but it's size will depend on the system you intend
to use it with :
- plain TOS has partition size limit of 1 GB,
- MagiC! is supposed to allow partitions as big as 4GB, but I had
problems with them (access to the content or even to a file took more
than 30 seconds, even with one single file of 64kB) and then went
back to 2GB size,
- MiNT is said to have no limit.

>
When MagiC! is installed, it puts everything - drivers, programs,
fonts, aso. - into C:\GEMSYS, and as C: might be as small as possible
(in case one might have to return to plain TOS), I wanted to move as
many of this to another partition.
I first simply moved files and modified data into inf files to match,
and everything seemed ok, but then MagXnet refused to work. :-(
Then, I totally reinstalled both NVDI and MagiC! directly into the
location I wanted, moved some files from there to where I wanted to put
them, did some tuning, and here it works :-)
I was advised to use symbolic links, but I don't particularly like this
method, I think it's not very smart, and I'd rather use it only in case
of real need - it wouldn't have solved the proble of space, however.

Message-ID: <d3u12s$794$03$1@news.t-online.com>
Source record: 13839

Hallo,

ich bin dabei, einen ATARI 800XL neu zu bauen und suche noch Anregungen oder Tips, um dieses Projekt auch fi¿½r andere Interessant zu machen!

Folgendes ist geplant:

1. 19" 2HE Standart-Industrie Gehi¿½use mit Backplane und Einschi¿½ben
2. 2 ATARI 1050 Folppy-Nachbauten mit integrierter Speedy1050
3. AD/DA-Wandler Karte
4. umschaltbarer CPU-Karte (ATARI-CPU, 65C02 + 65C816)
5. 64KB Arbeitsspeicher + 256KB RAMDisk als SRAM (RAMDISK Batteriegepuffert)
6. Bustreiber fi¿½r Adress-/Datenleitungen
7. Grafikkarte mit originalem ANTIC/GTIA
8. OS-Karte mit jede Menge EPROM-Pli¿½tzen
9. Cardridge-Karte mit jede Menge EPROM-Pli¿½tzen
10. PC-Keyboard Interface
11. Schaltnetzteil
12. RS232 mit MAX232/202
13. neue erweiterte MMU mit GALS
14. LCD Punktmatrix-Display 128x128
15. 16K BiboMon (Compy-Shop)
16. Centronics-Schnittstelle

Zuerst ne Umfrage wegen der Backplane:

Was wi¿½rdet Ihr nehmen? VME,ISA oder komplett eigene entwickeln?

Wi¿½rde mich i¿½ber Anregungen sehr freuen,

mfg,
Wolfram.

1463. IDE for the Mega STe?

Newsgroup: comp.sys.atari.st
Date: 2005-04-18 06:48:12 UTC
From: Hallvard Tangeraas <inv@lid.email>
Message-ID: <4263582a$1@news.broadpark.no>
Source record: 13840

Does anyone know if there are any IDE interfaces available for the Mega STe at the moment?

I know of several do-it-yourself (DIY) IDE interfaces for the ST/STF/STFM computers, using the rectangular processor, but with the STe and Mega STe there's that square PLCC socket which makes it impossible/tricky to use the same interface...

Hi. Is it possible to install Mint (Easymint to be exact) without having to use HDDriver ?

If I recall correctly, Mints need something called lnx partition without which they won't work. So, is there some other HDD utility that I could use which could allow me to install Easymint onto my Falcon ?

Thnx.

That would sure be nice. In the current stage of development I think it still has not surpassed CAB completely. For example: I can use CAB with MiNTnet and it's special CAB.OVL that supports SSL. I have done business with Paypal from my Atari Falcon years ago. I can view embedded Video fragments in combination with Aniplayer (Slow!). And I love to use CAB when editing HTML sources with QED. (OLGA protocol, smiley icon to detect syntax errors !)

Well, not DIY from absolute scratch.
However, if you know of a complete project like that where the PCB
layout and everything else is available and you know where to get the
PLCC socket I'm all for it!

I have a Falcon service manual. I will not sell it, but I will loan it
out, for eventual return. That is a really complex computer on the inside,
or maybe it is the best documented computer ever, but either way it is a
thick manual. I could get it to anyone who needs it, at least in the USA,
for pocket change, lots of pocket change, and it could be returned to me,
hopefully the worse for wear, for the same amount.

Is this offer of interest?

Jim

Try CBHD. You can create a large partition with this, but I dont know whether you can mark it as a LNX partition afterwards. Maybe you could create a normal partition with and change the ID manually with a hard disk editor. When easymint runs, it formats the lnx partition anyway (using mkfs).

Coda.

Yes, I've seen it, but I really need the PCB layout rather than just a
schematic -it's beyond what I can do (in reasonable time anyway).
If you do end up building it, would you care to upload this sort of
thing so others can built it as well, without having a Ph.D in
electronics engineering? ;-)

1473. Stacy for sale

Newsgroup: comp.sys.atari.st
Date: 2005-04-18 14:57:45 UTC
From: Coda <smeg_007@hotmail.com>
Message-ID: <1113836265.202215.72830@l41g2000cwc.googlegroups.com>
Source record: 13749

Well. I need to get rid of some of my hardware, and although I love my Stacy I don't actually use it for anything, so it has to go.

It has TOS 1.04, 4MB Ram, 1GB hard disk, and a High Density (1.44Mb) floppy disk drive and controller (fully automatic, no dip/toggle switches). The screen is nice and bright, useable in (not too bright) daylight. The machine is in superb condition, no damage, and all covers (battery, mouse etc) are present.
The machine comes with the original power supply, and a padded carry case that was specially designed for it, it has leather handles and also a shoulder strap.

I am located on the south west coast of England. Buyer can collect or postage at cost. Delivery could be arranged fairly locally. UK or Europe only (unless you collect).

Best reasonable offer gets it. Anybody want pictures, you can see the insides of it on my website, janthomas.org.uk, note that the machine is back together now :-) External pictures will be mailed on request.

email me at jan@janthomas.removeme.org.uk. remove 'removeme'.

thanks,
Coda.

PS. dont use my hotmail address, its just a spam trap and isnt often checked.

I am currently working on an internal IDE + RAM expansion card for the
Mega STE.

The good news is that it showed to work pretty well and I could drop my
loud SCSI drives and use fast IDE ones.

The bad news is that my card seats in place of the PLCC cpu thanks to a
quite expensive test socket. I am afraid that this might not be very
reliable on the long term. It is also not completely finished since I
only support the blitter at 8MHz or 16 Mhz without blitter nor cache.

Maybe some of you could share their experience they had with the PACK
acceleration board or the IDE adapter from Mario Becroft and tell me how
stable this was.

Fred.

I'm looking for anyone who is willing to sell BBS Express! ST (Pro version, I think - the last version I know of is 1.98a or there abouts), or has info on where I can get it.

I've googled for it, nothing came up, and I've searched places like Best Electronics and Bravo Sierra.

The later version I'm looking for was by C&R Systems, not the early releases by Keith Ledbetter.

Thanks everyone.

MiNT will work happily with any XHDI compatibile harddisk driver.

For ext2 partitions you have to use LNX marker, or if your driver does
not allow it RAW marker.

From: "Google@chamonix.zzn.com" <Google@chamonix.zzn.com>
Message-ID: <1113903440.691994.111460@f14g2000cwb.googlegroups.com>
Source record: 13759

Hi,

I have three Atari ST's to give away. Two were given to me a few years ago and have never been switched on by me so I don't know if they work.

The other one was given to me in 96 and had some keyboard problems, it hasn't been switched on since.

The three might be useful for spares etc.

I am in London, England. They can be collected from my house. If you want them, they are yours. If I don't get any takers in a week I'll put them on Ebay, if they don't sell on ebay they'll end up in land fill. Which would be a horrbile end to a lovely computer.

Please respond to Google@chamonix.zzn.com if you are interested or if you know anyone in the UK/Ireland who may be. I searched for Atari User Groups in the UK but only got dead links, if you know different then please get in touch.

Like I said I don't want these lovely machines to end up in land fill. If you are outside the UK/ireland but can make arrangements to pick up the machines but it will take a while, I don't mind.

Cheers

Jez.

From: Hallvard Tangeraas <inv@lid.email>
Message-ID: <4264db66$1@news.broadpark.no>
Source record: 13761

Jeg har kommet over en genre som kalles "Nu-jazz" og skal visstnok vï¿½re
en blanding mellom jazz og electronica/electro. Hï¿½res ut som noe som kan
passe meg, men jeg er ikke inni dette og vet ikke hvilke artister jeg
skal se etter.

Nï¿½ hï¿½rer jeg en del pï¿½ nettradio, og der hï¿½rte jeg en lï¿½t av Jazzanova
som var midt i blinken. Men dette virker ï¿½ vï¿½re et unntak -de andre
kuttene jeg har hï¿½rt pï¿½ (gjennom Amazon.com og andre plasser der man kan
hï¿½re smï¿½ kutt fï¿½r man kjï¿½per hele CDen) er ganske ennerledes, sï¿½ da er
det kanskje denne gruppa som definerer "min" stil. Jeg tok opp denne
lï¿½ta fra nettradio ("takes you back" i en eller annen ukjent mix) og har
lagt den opp her: http://home.c2i.net/w-460389/Takes_you_back__Jazzanova.mp3

Er det noen som vet om andre lï¿½ter/grupper som lager lignende greier:
altsï¿½, litt funky, kul groovy bass, kule synther, up-tempo men ikke
monotont som moderne dansemusikk ofte blir.

Tok ogsï¿½ opp en annen lï¿½t som sikkert ikke kan defineres som Nu-jazz,
men har noe av den samme "grooven" som jeg liker i seg:
http://home.c2i.net/w-460389/1.mp3
(nei, jeg vet ikke hvilken lï¿½t det er)

A search for "atari user group" on http://www.google.co.uk brings up a
link to the Cheshunt Computer Club on the third page!

Maybe one of our members might be interested, go for it lads, and
thanks for the offer Jez.

1490. UDS10 help?

Newsgroup: comp.sys.atari.st
Date: 2005-04-19 17:21:31 UTC
From: "Ronald J. Hall" <dark_lord@charter.net>
Message-ID: <pan.2005.04.19.17.21.31.64691@charter.net>
Source record: 13767

Okay, using:

"telnet 24.177.21.201"
"telnet 24.177.21.201 23"

results in telnet: Unable to connect to remote host: Connection refused

while this:

"telnet 24.177.21.201 9999"

works, allowing me into the config setup for the UDS10.

Can someone please list the possible reasons/settings that would allow me
to access port 9999 from my ip address but nothing else?

Thanks.

Mint itself dont need a lnx partition. It can be installed on a GEMDOS FAT
partition. It seems, Easymint wants to create a partition with ext2 filesystem.
This will be used for the UNIX like directory structure with UNIX command line
tools. My system has a minix partition instead.

Regards
Michael

I would assume that your UDS10 is 'listening' to port 9999.

... research (Google is your friend). From the UDS10's user manual
(available at http://www.lantronix.com/pdf/UDS10-UDS100_UG.pdf)

The configuration port is 9999. Thus, it is configured to 'listen'
for connection requests through port 9999.

Message-ID: <42657bc6$0$1241$8fcfb975@news.wanadoo.fr>
Source record: 13770

Hello,

Could anyone tell me what some of the variables in STinG cfg are for,
and which are irrelevant with STiK ?

```
ACTIVATE = TRUE
THREADING = 50
FRAG_TTL = 60
DEF_TTL = 128
ICMP_FLAG = 0
UDP_ICMP = 1
DEF_RTT = 1500
TCP_ICMP = 1
```

Also, what is the difference between FRAG_TTL and DEF_TTL ?
STinG's hyp documentation didn't tell me much, and I don't know where I
could find infos on those variables :-(

Thanks in advance,

J.-Luc

Ronald Andersson wrote a long time ago:

--- cut ---

FRAG_TTL is a timeout limit for the validity of a fragmented IP
datagram. If the fragments needed for the complete datagram have not
arrived within that timeout, then the datagram is discarded. The name
is an abbreviation for "Fragemt Time-To-Live". You should leave this at
the standard value.
(If this variable is not defined, an internal default of 60 is used.)

DEF_TTL = is the "DEFault Time-To-Live" for all IP datagrams
transmitted. This variable does not currently affect basic IP, as any
major deviation from the standard value would violate protocol specs.
Instead the internal DEF_TTL is forced to the standard value of 64.
However, some higher level protocol modules do use this variable, for
experimental purposes. It is strongly recommended to keep this variable
at the standard value of 64.

Yes, C&R Systems... Rich something or the other? Not sure about his name,
I forgot it.

I've got v1.98a, don't know if that was the last one or not. I started
mine up the other day, seemed the last call was 1998 or so. :-)

It was "The DarkForce! BBS".

BTW, do you have the manuals? I'd be willing to pay for your expense to
copy and mail them to me. I've got the full (key) registered version (I
think I paid $99 or something like that for it back in the 90's) but some
how or the other I've lost my manuals. I believe it was in a nice 3-ring
binder...

Thanks!

Rich put out what amounts to a keyless one, I've not unziped the file but I understand it's PD now. I have most of the manual stored away in one of my many box's, just not sure of which one. I live in a rented trailer and have stuff packed in boxs that I don't have room for. I think that all the pages are there, but not 100% sure. I'll have to look for them but it might take a week or so.

The BBS name seems to ring a bell someplace down in the deep, dank, dark hallways of memories. For some time mine was part of the ISIS network for Atari BBS's until the network was taken over by a far right church supporter and he demanded we all agree to his ultra far right rules and I pulled out of it then. I closed it down in 97 after my mother passed away and I moved back to the mainland.
My opening screen read: Welcome to the Black Hole BBS, Where Users Logon and are never seen again! I ran it on my TT030 which I still have too.

<grin> Hard to get rid of those old TOS machines isn'it it?

I never made it onto any of the networks - Fido, Isis, etc,... Always
wanted to, but never got around to it. I remember your BBS as well. I'm
pretty sure I had it in a list of Atari BBSs that I kept posted on mine.
I ran mine on a Mega ST, with the Adspeed upgrade. I had 10 CDROMs online
at one point.

BTW, just out of curiosity, did you manage to make Express work with the
enhanced serial ports on the TT? It has 4 alltogether, right? I was just
thinking of 115,200 speeds. :-) I never got mine past 19.2...

See ya!

Source record: 13784

I aways just used the normal port (modem 1), I've head of people getting faster speeds on those other ports but BBS Express ST only went up to the 19kb level. After my Falcon fried itself, I've been left with my TT and a 1040ST which got celeing dumped on this winter and the keyboard is now shot, hope to replace it this summer time if all goes well.
I think I used to see notes about your board when I was on CI$ before the aol takeover.

Hay maybe I could get the ISS to drop down a line and hook and he could let
them grab it, after all, they're only going about 3 miles a second.

Same problem here - I tried that RSVE upgrade, got kinda faster speeds
using Flash to connect to PC boards here in this county that were running
faster speeds, but never could get Express to answer an incoming call
correctly. Oh well. At the time, 19.2 seemed pretty good. :-)

Not necessarily. I just think that with the exchange rate, most US
buyers would not be interested thats all. Besides, shipping will cost a
fortune.

Hello,

I'm looking for a wad file to use with pm-doom. I went to Patrice's
site, but unfortunately couldn't find any link using CAB (will give
HighWire a try if possible).
Google wasn't my friend either, as the only things I found were many
little wads, but not the (supposed to be) nearly 2 MB wad.
Could someone lead me to a working link ?

Thanks,

J.-Luc

Hi,

I am not able to start GIM on my Milan. Can't see anything obviously wrong.
Reinstalled but made no difference.

Using FreeMint 1.16.2, Naes 1.2, Mintnet.

It just crashes at boot-up and wrecks Naes meaning I have to re-boot.

Sorry to report problems.

Peter

I have a friend in Ohio, they still have no Idea who rolf harris is yet...

A lot of people have asked me to post a ST or monitor outside of the UK, I think one guy paid like 50quid to have a monitor shipped to netherlands... Even had people from OZ asking... Unless someone has a LARGE wad of cash and in extreme dire need of the "item" there is little point in offering it to anyone outside of the UK.. Dont forget that UK can miss out just as easy on US stuff!!

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods! So not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you may not be able to find anymore at Swap Meets, Thrift Stores or even Auction Sites! And I sell for less! And unlike those who will remain anonymous! I test Goods before I sell them. So not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, partly because I'm the guy most people come to when they want to give their Ataris a New Home! I'm saving Orphaned Atari's from Oblivion! Goto http://BensCatalogs.Atari.org or Call (503)256-9974! I'm not asking a lot, I'm just trying to make a living and I'd like to earn your Business!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

The above is correct. You must have software that burns ISO type CD's. I have a STe and when I use my Atari clone, the Hades060, to burn any CD in the ISO format, the STe can read it perfectly.

I have Magic boot up using my D partition. As for MagicNet, I still use the C partition. I just created the necessary files/folders on the C drive. This all means I have two GEMSYS folders, one on the C drive and one on the D drive.

I have seen some posts about using Compact Flash drives instead of an IDE drive. Also one can get an IDE to SCSI adapter. So, I guess the quietest Falcon, would be one with both these adapters in place. Has anyone used Cubase Audio with an IDE drive + IdE to SCSI adapter?

That's great news!

> The bad news is that my card seats in place of the PLCC cpu thanks to a

And too expensive for the rest of us -I've seen the prices of those
sockets by searching the web. Around US$ 200 !!
You need a "through" socket, don't you?
Is it 68 pins? I could ask around if you have trouble finding them.

> It is also not completely finished since I
> only support the blitter at 8MHz or 16 Mhz without blitter nor cache.

Ideally, the memory upgrade shouldn't affect anything else.
Is this possible?
The blitter is useful, and there's a noticable speed boost at 16
MHz/cache, but I need to be able to switch it off as well since Notator
SL doesn't work with it, but automatically switches it off when I run
the program.

> Maybe some of you could share their experience they had with the PACK
> acceleration board or the IDE adapter from Mario Becroft and tell me how
> stable this was.

Why not ask Mario directly?
He may have a source for the PLCC sockets as well.
Here's his Atari hardware page with contact info:
http://gem.win.co.nz/mb/atarihw/

I'd say that falcon fan makes more noise then modern hdd.

Most Falcons I have seen have the fan removed (including mine). I dont think it did much anyway.

On the subject of using IDE with Cubase, this is something I have been thinking about, and im actually in a position to test this, as I have an SCSI=>IDE converter. I just took the noisy 1gb SCSI drive out of the TT and replaced it with a silent 10gb IDE drive. I have an 8gb+ MiNT partition now... I still use a SCSI jaz drive (1gb) on the Falcon for recording with cubase, so I need to test an IDE drive with the converter, and see if CAF complains.

I have also bought a CF IDE adapter, unfortunately I had a load of problems but I think its the CF card I have (Viking 512mb from ebuyer £25 (its a rebranded toshiba)). Win XP refuses boot if its plugged into the PC, but linux on the other partition boots, and I can do whatever to the virtual disk.

With the tests on the Atari platforms, non of the harddisk driver software could handle the card properly (ahdi/cbhd/hddriver) but as before, because of the afforementioned problems with XP, I think its the actual card, and not the IDE=>CF converter.

Coda.

Message-ID: <6vaae.116698$vL3.7012@bignews4.bellsouth.net>
Source record: 13712

Maybe I didn't make myself clear on this subject as I have
gotten replies about hard drives not disk drives.

What I was asking about is the Internal Atari Disk Drive or
floppy drive as some may call it. The one that uses 3 1/2
disks. The thing that you put game/Application software
into.
Not CDs, Tapes, or Cartridges.

Just a replacement High Density Disk Drive.

I need a good Brand/Model replacement High Density Disk Drive to put
into
a Atari Falcon. One that does not need any modifications and will just
PLUG n PLAY so to speak.

If anyone has recently done such a replacement, could you post or e-mail
me the Brand and Model number.

Maybe I am wrong, but I am under the impression that not all High
Density
Disk Drives will work in the Falcon without modification of a jumper or
something. Correct me if I am wrong on this.

I have a Brand new Sony Model MPF920-1 Disk Drive that I think is
High Density, but before I go and plug it in, I'd like a little more
info on what to look for when replacing a High Density Disk Drive
in a Falcon.

phantomm@bellsouth.net

Time to put the Hip Boots on its getting Deep

No. You need something that plugs *into* the PLCC socket on the ST board,
and that is soldered to the bottom side of your expansion PCB.

On the MagnumST, we used something like this:

http://www.cabgmbh.com/deutsch/index.cfm?fuseaction=elektronik&rubrik=spezialfassungen&produkte=69

http://www.cabgmbh.com/deutsch/downloads/elektronik/pdf/D_42_01_03.pdf

These give good contact and make a stable connection, provided the board on
top is not too big - some additional attachment may be needed nevertheless.

I would not recommend any of the home-grown solutions that insert rows of
single pins into the PLCC socket - either with the CPU still in or without.
These damage the socket and dot not make good contact for a long time. I
remember these froma lot of ST memory expansions that claimed "solder-free
installation" - it worked for some time, but then it became flaky.

Is this a smart move?
There's got to be reason why they installed a fan there in the first place.

My Mega STe fan makes an awful lot of noise as well, and I would like
nothing more than to remove it and replace the hard drive with a modern
"low noise" laptop type. All this noise is indeed killing any
inspiration and concentration that is needed when I use it to make music.

So not a wire-wrap "through" socket like the ones used for HD/DD disk
drive circuits then? I found several links to manufacturers of those
kind of sockets here: http://www.interfacebus.com/ic_sockets.html

As I understand from what you say you need the socket that solders to
the bottom of the memory expansion PCB, then on the other side of that
PCB another socket is soldered, and the 68000 processor is put here. In
the end the whole memory expansion or IDE PCB is plugged into the Atari
68000 socket. Correct?

I didn't find any prices there. Are they just the manufacturers?
Where can these sockets be bought?

> These give good contact and make a stable connection, provided the board on
> top is not too big - some additional attachment may be needed nevertheless.

Having opened up and looked inside the Mega STe and STe, I noticed that
some of the socketed PLCC type ICs had metal "straps" placed over them
so they won't loosen and pop out of their sockets accidently. I guess
this can be done with the new top socket on the memory board (where the
68000 is inserted) as long as those sockets have fastening points for
this, but is there something similar for the socket that attaches to the
Atari mainboard PCB socket? If there's no such solution I guess some
hot-melting glue along the sides (be sure it won't flow in, along with
the actual connector pins) will help keep it in place, and shouldn't be
too hard to remove if the memory/IDE board needs servicing.

By the way: how many pins does the PLCC 68000 for the STe/Mega STe have?
I seem to recall 68 pins, but could it be 52?

This must be a "musician" thing. I mean, compared to my Mandriva-Linux box, my Falcon, with a CT60, PC power supply, original MB fan, 80 gig IDE HD, floppy, and Plextor CDRW is next to silent...

Of course, that could be because there is a 6000 RPM Volcano CPU fan in my Linux box... <big grin>

All the Falcon mobo fan does is pull a little air (and DUST, the chip killer!) into the case. Maybe they decided to do this at a time when Hard drives ate so much power that they heated up the whole box, or maybe they intended to run the CPU at 32mhz?

The MegaSTE fan is built into the PSU, and is really for cooling that down, but does actually create a little airflow around the system, but as above, I would ask WHY? what is there that gets even warm?

I have an ATX psu inside my case (without cooling fan!), plus a 10gb IDE drive taken out of an XBOX (because theyre big enough, and designed to be quiet).

Coda.

But the problem could also be the actual blanks he used. I have had problems with two TOSHIBA CD-ROMs on my Falcon reading some Maxell disks with coloured (dark-looking) surfaces. Copying them on a PC to a 'silver' type blank made them readable.

I know of no kind of "through" socket for PLCC, especially not wire-wrap
ones.

Correct - that is the only reliable way to get connection to all the MC68000
signals in the STE.

>> On the MagnumST, we used something like this:

(this should be "Magnum STE" - the Magnum ST was for the ST, and had
DIL-style sockets where you could either pu the 68000 on the MegnumST, or
you could simply solder an extra socket on top of the 68000 and plug the
MegnumST into that, since it was simply in parallel).

Only the STE with the PLCC CPU socket is more tricky.

I think we bought them from CAB in Germany. Not sure if they are
manufacturer or only distributor.

Yes. However, when using high quality PLCC sockets (which Atari did not do),
then this should not be mecessary.

>this, but is there something similar for the socket that attaches to the

Yes, something like this will be needed depending on the size / weight of
the expansion board that sits on top of the CPU socket.

>By the way: how many pins does the PLCC 68000 for the STe/Mega STe have?
>I seem to recall 68 pins, but could it be 52?

This looks like one of those, for 68 pins:

http://plcc-adapter.com/Part/PLCC-sockets,68PL-W.htm

It looks like this site has all sorts of PLCC related items, so there
should be something suitable for these projects there.

>>> On the MagnumST, we used something like this:
>
> (this should be "Magnum STE"

Sorry, I meant the Magnum STe of course.
A bit quick in replying there ;-)

I know the 68000 procesor of the ST/STF/STFM is of a standard DIL type
(and probably more suited for various hardware projects), but I still
prefer the STe/Mega STe computers to them.

Apart from the obvious differences to the sockets of the Magnum memory
boards, were there any other differences between the ST and STe versions?

>>I didn't find any prices there. Are they just the manufacturers?
>>Where can these sockets be bought?

I'll look around some more and see if I can contact them.

Typical Atari to save a few cents here and there.
So now we know why they had the slogan "Power without the price" ;-)

So you're saying that there are some mechanical differences between the
high and low quality sockets, where with the low quality ones the ICs
can easily pop out?

>>this, but is there something similar for the socket that attaches to the
>>Atari mainboard PCB socket? If there's no such solution I guess some

Any available solutions to "strap" the new socket to the Atari PLCC
motherboard socket?

>>By the way: how many pins does the PLCC 68000 for the STe/Mega STe have?
>>I seem to recall 68 pins, but could it be 52?

I must say this is an amazing piece of software that Lonny put together. I must admit I did not know this kind thing existed. The Atari version works great on my Hades under MagicNet (will try it under MintNet as soon as I fix my Mint partition. Right now it is toast). I downloaded a VNC server for my wife's PC and got it working. Then I booted up the aVNC program in the 32-bit color mode and the PC's desktop came up in a box. I was thrilled to death when this happened. I noticed that when I moved the mouse on the PC, the pointer on the Hades screen also moved. But if I tried to run a program, the Hades crashed. I could do this in the 256 color mode, but of course, the graphics where not as good. In the 16-bit mode, the Hades crashed as soon as I ran the aVNC program. Maybe the aVNC program needs an upgrade or I need to fiddle with the settings on the program and/or my Hades. Still, great job Lonny...

No. This is just a plain PLCC socket with wire-wrap pins - I have no idea how you want to plug that one into the existing PLCC socket on the STE board.

>> (this should be "Magnum STE"
>
>Sorry, I meant the Magnum STe of course.
>A bit quick in replying there ;-)

No, the error was in my original post.

>Apart from the obvious differences to the sockets of the Magnum memory
>boards, were there any other differences between the ST and STe versions?

The STE version runs the memory at 16MHz, giving "real fast" RAM.

>So you're saying that there are some mechanical differences between the
>high and low quality sockets, where with the low quality ones the ICs
>can easily pop out?

The problem does not seem to be ICs popping out - that can happen with high-quality sockets, too, but requires quite some force (german post seems to be able to achieve this on some occasions).

The big problem with the Atari sockets was bad contact although the ICs were still inserted.

>Any available solutions to "strap" the new socket to the Atari PLCC
>motherboard socket?

Not really - PLCC sockets are not designed to provide a mechanical connections for more than a PLCC IC. It would probably better to strap to the STE mainboard somehow.

>

Well version .906 is a little better for me. Still crashes the Hades in the 32/64K modes. May need to try different combo's of the graphic encoding methods. The 256 color mode still runs find, but sometimes the mouse clicks do not register. The 32-bit mode is better and I can move the mouse around, but the computer still crashes when I try to run a program. Also in the 256 and 32-bit color modes I keep getting a message when I move the mouse around. It begins with ()fre and talks about a number being too low and then replacing it with a higher number.

Anyone,
Just wondering if anyone can suggest a program that would change resolutions
and color depths. With the program release by LP of aVNC I have to take
an interest in raising my color depths especially to true color to be able
to see if this program will work. I do have it connecting to my MAC but the
screen is all messed up. Any help or suggestions would be greatly appreciated

Thanks,

No crashes here on my Hades running in 16-bit mode (freeMiNT
1.16.2/XaAES). I could surf the net using Opera 8 or Mozilla. I even could
read a pdf-file using Acrobat reader 5.

The reaction is rather slow but it works. Now I'm trying to get it running
with my Linux box but for some reason no luck so far.

Can someone tell me hows to set up Xvnc or tightvnc on Linux (Suse 9.2)?

It was my fault. By default the firewall is up and running. I've setup the
firewall so I can use vnc.

But alas, I can make a connection but the colors are totally messed up, no
mouse action, etc ...
On Linux I use also tightvnc

24/04/2005 21:27:54 Got connection from client 192.168.2.4
24/04/2005 21:27:54 Protocol version 3.3

I've often wondered about this, as the Falcon fan is in a very curious
position. Is your Falcon in the stock unmodified case? If so, how
warm does the room get before you have problems?

Galen (who eventually needs to replace or remove his Falcon's fan)

I did get one working that goes through the X server for Atari. The trouble is we don't really have a standard x server implementation and while I could watch what the Atari was doing, I couldn't control it. I posted a screenshot here that should have been enlightening though. To be honest I haven't continued that work because lp's path of creating an atari specific app is the most proper way. As he's demonstrated, he's the best person to make the server too ;-) lp, can you link to gcc libs?

Thanks,
Mark

Joe,

Assuming you use easymint,

Install ne2kenec.xif (from http://www.assemsoft.org) in your C:\mint\ver\
folder (where ver is the version you are running). If you don't have an
030 or above though you should use enec.xif from the original
distribution. If you're not using that system, you can just install it in
C:\mint\. Then just modify u:\etc\sysconfig\config.if. Change the ne0
line. the file has instructions. Also modify
u:\etc\sysconfig\defaultroute. The interface btw is "ne0" as it shows in
the example.

Once this is setup, you should reboot. Verify ne0 is up by
doing ifconfig from a command prompt. Once you see it's up right, try
pinging your gateway (the router). If you get pings back you should have
internet access through any mintnet proggie. Then install gluestik and
whala, all atari stik apps will work too.

Thanks,
Mark

The new aniplayer still can also, but the mp3 encoder LAME_ENC.OVL isn't
distributed with it anymore. You'll have to get a copy of LAME_ENC.OVL
from an older Aniplayer distribution.

Are you sure ?

Didier.

PS. It's a shared library (.SLB) not an overlay module (.OVL)

Yesterday (the 24th) Henrik of Nature (nature.atari.org) did the first enumeration of a USB device on the 16/32bit Atari platform. This has been achieved on the Ethernat by the test program that I wrote for that card and the CTLink.

The plan at the moment (USB) = One hardware driver for all setups
(TOS/MiNT/Magic).
TOS and Magic (If I get round to it) will have device drivers that
plugs straight to the hardware driver, MiNT will have its own USB stack
that each driver connects to. This still leaves the question of
applications needing to be re-written to accomodate the new stuff where
the OS cant be patched, but this wont be a huge deal.

Test programs only at the moment, work on the proper drivers wont
commence until I have some hardware (except ideas on paper and research
etc).

1585. [ANN] DGEM 0.18 release

Newsgroup: comp.sys.atari.st
Date: 2005-04-26 16:11:03 UTC
From: Pierre TON-THAT <geek@atarians.com>
Message-ID: <426e6816$0$21148$7a628cd7@news.club-internet.fr>
Source record: 13662

Bonjour :)

DGEM is a project that intends to be a Dungeon Master clone.
A new update is available on my website or directly in the folder:
http://rajah.atari.org/files/ -> dgem018.zip (650KB)
Carefull: it takes 2.6Mo on HD.

New features for this 0.18 (April 2005, Jaguar Connexion 2K5 release)
+ on characters: eating, drinking, sleeping, homeostatis, death,
ressurection, weight carried, experience gain, damages, resistance,
selecting the leader, fatigue, poisonned state, etc.
+ with objects: most are usable now, some can modify characters
parameters, some can be used in hand, some are with charges...
For example, the lockpicks may work on some weak keyholes, the rope
permits to climb down into a pit, some doors can be broken by sword,
torch burning...
+ magic: all that is not thrown (ie fireball or dispell)
2 new incantations for zo potion and alcohol.
try the 'see through wall' or 'magic footprints' ;)
+ action: with objects or nothing (with associated sounds), all
is possible except throwing (magic or object) and shooting.
try the fluxcage of the powered firestaff.

Coming next : MONSTERS (enfin !) ;)
Throwing objects and casting the remaining spells should come after.

Hope you'll enjoy.

Carey the aVNC will give you a messed up screen if you do not have it in the correct color mode. I got a messed up screen when I used it in the 24-bit color mode. Works great for a while in the 32bit mode and works like a charm in the 256 color mode. It was kind of neat controlling and using my wife's PC from my Hades desktop.

Not too bad, was I being too terse?

In jinnee at least, you can click on the drive icon and then use the
menu item "Eject", CTRL-Y, drive spins down (and thus "saves energy").
I don't know of any other way of energy saving, unless there's
something in the CT060 apps.

There are ACCs, which allows spining down disks after certain period of time as well... One of them is Autoparker which came with HDDriver. Dont need any special hardware or software.

The best IMO is to use a good DTP software, and create your layouts - I
use Calamus SL.

1599. My Mail v1.74

Newsgroup: comp.sys.atari.st
Date: 2005-04-27 20:25:09 UTC
From: neil@adel6.freeserve.co.uk
Message-ID: <d4osf5bio1@news6.svr.pol.co.uk>
Source record: 13670

I know Erik Hall has suspended development of this very useful STiK 2 software, but I was wondering if he was still beavering away behind the scenes? Does any one know?

Unfortunately I now find the program unusable because a fault in sending emails has made it impossible to continue using MyMail.

When sending emails the program would display the following alert:

Failed to connect.
HELO/EHLO message fail.
Resp code (-4)
OK

After clicking OK, another alert would appear:

Failed to start dialer
counts down from 10 to 1
OK

The program started doing this when I upgraded to this last version, but only very occasionally! Reseting the Mail Queue was sometimes enough to get things sent, but the problem has increased now so that it happens everytime I try and send any emails. No problem with receiving.

I've returned to using Emailer, but find its Distribution list functions very restrictive! Editing the Address.txt means setting the line length to 255 chars otherwise I can't fit more than 5 email addresses onto a Group entry. Or is there another way of doing it?

Thanks

Neil Chester

Hi all,

I recently aquired a Falcon but I'm having problems with it. If I load any floppy into it (including ones that I know aren't corrupt via use on my st) all I get is an error message stating that the data on my disk might be corrupt. I recently replaced the floppy disk drive with a new atari drive but I still get the same message. Does anybody have any ideas what the problem might be?

all the best,

Mark

Would v1.73 solve your problem? If it is a recent bug, it may not be
in the previous versions.

Galen (who believes that he is still using 1.56)

No problems here either on Falcon in 16bit mode. AVNC also offers
flexible video translating settings, so it can be customised to any chunky
mode depth.

I had the same problems when having EtherNEC plugged into my cartridge port,
still don't know why, but each time it was unplugged my floppy drive worked
fine.

Hi BJ,

Surprised no one said hello.

What are you doing on the TT regarding getting it online? I assume
youve either got a network card, or your connecting via serial to your
PC?

Coda.

I assume you mean for printer drivers. It may not be an issue. All the USB driver has to do is shove the output of the NVDI printer driver down a USB bulk pipe to the printer.
A work around would be to "print to file" with NVDI and then I could provide a utility to dump this file to the printer via USB. On the other hand, it should be possible to create a resident print spooler that spools to a USB endpoint instead.
Even without new NVDI printer drivers, at the very least Atari users will still have the option to buy printers that dont have Parallel ports, even if the choice will be (slightly) limited. I have an Epson R300, which im sure will print fine using one of the epson stylus drivers that comes with NVDI 5.

Coda.

You could split your addresses into smaller "Distribution lists" and
then make another list using the names of your smaller lists as
addressees.

To anyone,
I have all ready downloaded CENTSCREEN (had it on my computer from a past attempt at installing it and getting it to run. I am needing some assistance at installing CENTSCREEN. I know that this has been advised for ENERGY STAR related topic. But I am also hoping that this will help me to be able to run aVNC as well. I need to increase my color depth to TC and hopefully a 800x600 screen resolution. Any reason why this would not be possible with CENTSCREEN?? If it is how, I need to know how to install CENTSCREEN from beginning to end. Everytime I run CENTSCRN3.prg it says invalid VIDEO.DAT file if this helps.

Thanks,

Hi Edward

Yes I am usually connected via Stik2, I can retrieve the emails in my
inbox but when it comes to sending out replies etc the program bring up
the first alert box and then gives you the option to place the outgoing
email into the mail-queue. But recently this has proved to be the
sticking point, desperate measures means editing the QTEXT.TXT file and
sending the emails via Newsie.

Do you get the Alert boxes? I wonder if one of my settings is incorrect.

Thanks

Neil :-)

Hi Galen

I remember that v1.73 had similar problems after a while, it seems to occur after a few months of using it. I am wondering whether I have too many emails stored or there is a file that needs clearing out somewhere, eg too big.

Failing to connect to mailbox is rubbish as in the same session I can interrogate it with Newsie.

Maybe re-installing the program files might do it, but I don't want to lose my emails and addresses.

Hi Derryck

I did wonder about that, so the following could be used:

Dist List1 email1,email2,email3
Dist List2 email4,email5,email6
Master List Dist List1,Dist List2

Have you tried this?

That then solves the lack of MyMail, although it is still a challenge to get it working again. Although I am short of time to do it, I still haven't got a stable CT60 after months of not doing anything with it. A cooling problem is the bane of the project....

Cheers

Neil :-)

1613. Re: Hello & TT online

Newsgroup: comp.sys.atari.st
Date: 2005-04-29 00:26:20 UTC
From: Maurice Veale <maurice@abod.co.uk>
Message-ID: <opspywt6eqgcg140@81-174-216-245.pth-as9.dial.plus.net>
Source record: 13690

Hi
Years ago I managed to get online with an STE and Cab until my ISP closed down
after a short time - so I never really got into it. Bought a PC for web stuff & family
and continued to dabble with Ataris. I still use "Home Accounts 2" to do my accounts and when all else fails on the PC I return to 1st Word Plus on Gemulator. I've been slowly upgrading a TT I bought over a year ago. Started out as 2MB ST memory without hard drive its now at 10MB ST memory, 32 MB TT memory 230 MB Syquest removeable Hard drive, Iomega Jaz Hard drive, Nova Graphics card (not yet working) . I managed to pick up a new SCSI memory card reader to transfer files between PC and TT. Now I'm ready to start using it partly for fun partly as a hopefully virus free work space.
I'd like to connect the TT directly to the internet through a modem. I cannot remember how I did it with the STE, it was a long time ago. I do remember that I spent many hours trying out different files and configurations. This is my first TT. So I'd appreciate any help or tips to get the TT online as easily as possible.
The TT has 4 possible connectors for the modem, which is the best for direct internet access? For practical purposes is the only difference between the various serial & modem ports speed of data transfer? Or do I have to configure software differently for each port?
What's the best software for this? .I have Harlekin 3 that I used a bit for BBS connections and also ST Fax2. I have Sting 1.26 and Cab 1.7 to use on Tos. I could use Cab and PPP Connect 1.5 with Magic 5.11 but would that combination work on a TT it didn't work when I tried it on a Falcon? Suggestions about the best combination that works would be very helpful. Do I need to update my internet connection software? Of course i have tried to configure PPP Connect for my ISP so far without success but I want to make sure I've got the right software before I really get stuck into it. I have managed to find my Zetnet info to help with configuring Sting from my last Atari internet connection and have trawled the Internet for Info. Does anyone know of an Atari friendly ISP in the UK?

regards
Maurice (BJ)

Hi Coda
Yup its BJ. Obviously having a little difficulty masking my email
from potential spammers (see header)when using Opera. Back to TT things.
I guess if I ask specific questions I may get more response. So I'll do
that
in the "Hello TT online" string. basically hoping to connect TT directly to
the internet through a modem.

regards
Maurice (BJ)

1619. The DarkForce BBS (beta testing)

Newsgroup: comp.sys.atari.st
Date: 2005-04-29 14:07:16 UTC
From: "Ronald J. Hall" <dark_lord@charter.net>
Message-ID: <pan.2005.04.29.14.07.13.701207@charter.net>
Source record: 13696

Okay, I've got Darkforce up and running right now. Tons of things remain
to be done, but I wanted to let you guys access it and report anything
amiss to me.

Obvious things:

Express is reporting the connect rate at 300 baud
Date is showing up as ":5" instead of "05"
CDROM section is not working - you'll probably just get a script error or
a timeout. (don't even have CDs hooked up right now)
Bulletins and announcements are hopelessly out of date
The free prize giveaway has been suspended. :-)

The original user logs are still in place, so if you had visited us before
and remember your username/password, you can log right in.

The initial sequence is:

telnet 24.177.21.241

escape character is "^]"

then an ASCII <return>

After that, the BBS software should kick in (God willing and the creek
don't rise). :-)

I'm working this weekend (36 hours) so I'll just leave it up over the
weekend then pull it back offline on my days off to start updating the
bulletins and announcements.

The board supports ASCII text, VT52, and ANSI. ANSI is actually
automatically detected if you're using it.

All comments and criticisms are welcome, especially suggestions as to
solving any problems found. You can leave e-mail/feedback on the board
itself, post here in the newsgroup, or email me personally.

Thanks everyone! :-)

> file if this helps.

800*608 will not be possible in TC, reasonable maximum is 736*544. Even
that is possible only with bus accelerated CT60 or CT2. Same for 640*480
TC, u need 25mhz bus. Using centscreen is fairly easy, u put centscreen.prg
in auto folder, centscreen.rsc and video.dat in root of auto folder and
reboot. Thats all. U then use centvidel to create resolutions regarding of
your needs, and monitor capability, and use videomod to pick default res
for desired colordepth. Thats usefull mainly for MiNT and Magic, since on
those OSes centscreen don't display its own res selector..

25mhz bus allows resolutions up to 944*704 in 16/256 colour mode and
736*544 in TC. Bigger resolutions causes refresh rates to drop, even
mentioned resolutions are on edge, 62hz.

Hi,

I'm going to setup a website dedicated to the great Music Studio by Activision. I'm trying to collect every version of this great program, and I also own the original MS version for Atari. But, I wasn't able to find the Atari ST version, so I thought I might look here. If you have a copy to share for free, please send me an email.

Thanks in advance for your help, and support for my site.

Normally you would use the SCC-based ports for speed and Serial2 has
the most control lines. You need HS Modem to take advantage of the
speed.

> What's the best software for this?

Unfortunately this depends this depends on your ISP. Until a few
months ago, I used STiK 2 under Magic 6.20 on this TT, but then my ISP
made some change and both STiK and STiNG stopped working, and I had to
switch to MagicNet, which works well, but for some reason that I have
yet to determine, not as quickly as STiK.

1627. Re: CENTSCREEN

Newsgroup: comp.sys.atari.st
Date: 2005-04-30 03:19:49 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <PJCce.139856$UW6.12295@bignews5.bellsouth.net>
Source record: 13604

Just a note here...

I have a CT2B Falcon using CentScreen and I use it in 800x608 TC mode
all the time.

This is on a SVGA 17inch Monitor. I think it might be a interlaced mode.
And I had to experiment with the settings abit to get it there.
But Its very stable, and no problems with graphics software.

However that is about as far as I can go in TC mode.

And with the CT2B, I can run Apex Media in 640x480 TCmode
on a SVGA which is nice.

I have Screen Blaster II and it will do 1280x960 in 256 colours
on a Stock Falcon IIRC. And even higher resolutions in 16 colours.

I also have a Blow Up Hard Internal in a Falcon and the
BlowUP Hard II which is similar to the ScreenBlaster II
It connects to the Falcons Monitor port just like SBII and
the resolutions you can get are about the same.
The software for the BlowUpII seems abit more
easier to use. But I think the SBII software has
a few more options to experment with and
has a preset Genlock Mode.

Both Devices are hard to beat for what they do with no
soldering. They plug into the monitor port and have a small
cable that plugs into one of the advanced joystick ports.

They will work on a RGB monitor as well as VGA/SVGA and
have preset video modes to choose from and you can also make up
your own.

They work well especially with Gem type Graphics Apps and
WordProcessing,
DTP software. I've also used them with some Gem D2D recording software.

You'll have tons of room for displaying Pics with programs like
ImageCopy.
And lots of room to work with Graphics Apps like TrueImage, Positive
Image
and the like as well as DTP/WordPro. stuff.

I've not fully tested the BlowUp II yet. But I know from my experience
that
you get Rock Steady Clear Displays that will really suprise you and
are nice for various work in High Resolutions with SBII.

You can also setup Virtual Screens that scroll which can be really
large.

You can do a little better with TC Modes over the standard stock Res.
But for anything like 640x480TC or 800x600TC you will need a good
upgrade like a CT2B. Or maybe a VideoCard like the Nova, I think
there were a few others made, but haven't got my hands on em yet.

IIRC, the Nemesis suppose to allow 640x480 TC but I'm not 100% sure on
that as mine was buggie and I removed it.

If you have a stock Falcon and want to get into higher resolutions in 16
and
256colours and can make it without the higher TC modes.
Go for a ScreenBlaster II if you can find one. It would be the Biggest
Bang
for the Buck. Or the BlowUp II as it should be just as good.

As u said, its interlaced... U can get very high resolutions, but
they are bad for the eyes. Another thing is that they consume massive
ammount of bus and sdma time. That is why 640*480TC etc are only
reasonable with Ct2 or bus accelerated CT60. Both card also have fast
STram acces so expanded resolution on them are nice. For example:
928*704 in 256c on CT2 is faster as as normal 640*480 in 16 on stock
falcon. Thats because of faster bus and because CT2 acces STram realy
fast. If u enhance resolution on stock falcon, u also get slowdown...

Bus/sdma loads are main reasons for very fast mono modes and slow
TCs, its just much more data to move arround..

>
> I have Screen Blaster II and it will do 1280x960 in 256 colours
> on a Stock Falcon IIRC. And even higher resolutions in 16 colours.

That is possible with SB2, videl at 60hz and REALLY lousy display,
some 40hz refresh in inrterlace, giving u 20hz refresh.. And u need
good mutisync monitor as well...

It is not that easy to find perfect overall resolutions, that would
be nice to the eyes, wouldn't load sdma too much and be extreme big :)
I recomend noninterlace modes, with lowest refresh of 60hz, but even
that is on edge, esp with fast monitors. If u have Ct60, think about
enabling bus acceleration and make it 25mhz. It does help a LOT. Not by
resolutions only, but speedup entire system, resolutions are bigger,
faster, hdd is faster etc...

> If you have a stock Falcon and want to get into higher resolutions in 16
> and 256colours and can make it without the higher TC modes.
> Go for a ScreenBlaster II if you can find one. It would be the Biggest
> Bang for the Buck. Or the BlowUp II as it should be just as good.

Its quite hard to choose :) SB2 has better hardware, and can achieve
better resolutions, but setup application is weird, at least :) BlowUP
has realy nice software, esp with Blowup hardware, where u can switch
betwen virtual res and real res in moment. But betwen all res enhacing
apps, my fav is Centscreen..

Hi NG

Just finished fiddling with the SCSI on my trusty old STacy 2. It has the ADspeed chip installed, which means that the Power board barely fits over the slightly higher CPU-socket. Is this a problem?

After fitting the STacy back together again, I noticed a loose component, which I suspect have fallen out from some place near the power inlet. The component looks looks like a small darkbrown resistor, but without legs. It has a completely cylindrical shape and is a couple of millimeters long. It also could be some sort of condensator.

I figure that this missing component is connected to the power failure. The STacy does not react at all when trying to power it up.

I cannot find any empty sockets or abandonned soldering islands on the up-side of the motherboard.

Can anybody give me a hint?

Thanks, Peter Feddersen, Denmark

You dont run Centscreen from the Mint.cnf. It goes in the auto folder, and runs AFTER NVDI but BEFORE mintxxx.prg.

cntscreen.cnf goes in c:\ and I think the the .dat file stays in the Centvidl folder so centvid.app can find it. Make sure you have the correct centvid patch installed for the clock speed of your falcon bus (the 40 or 50mhz xtal on the CT60).

Coda.

Hi Everybody,

I have a Falcon/CT60. Could someone be kind enough to tell, step by step, how to install that program on my machine....it's been a bear, and my Falcon refuses to autoboot from the boot disk.

Help!!!

Thanks,
Samf

BEST way we can offer is RTFM (Reat The Fucking Manual) where it say
this:

Put the CNTSCRN3.PRG in your AUTO folder of your boot partition. Put the
CNTSCRN3.RSC and VIDEO.DAT in ROOT of your boot partition, eg C:\ if you
are booting from C:

And that is all.

In same doc (CNTSCRN3.TXT) there are alos hints where i AUTO folder
CNTSCREN3.PRG should be, virtual screen setups, energy star setup etc etc
etc...

> this:

OK, i just noticed that you may actually did RTFM, but it was all
French :) Sorry. Here is small Centscreen tutorial:

Centscreen package consist of 3 applications:

1. CNTSCRN3 is actuall resolution switcher and ehancer
2. CENTVIDL is tool to create your own resolutions, different to those in
supplied *.DAT files
3. VIDEOMOD is some kind of default videomode selector, and its needed for
XaAES, N.AES or Magic, since they don't use same protocol to swtich
resolutions, so u need to select default mode for each bit depth.

Centscreen:

Copy CNTSCRN3.PRG to your AUTO folder. Place it after NVDI and BEFORE
MiNT (blowup and screenblaster prefers to be AFTER MiNT). Copy CNTSCRN3.RSC
and prefered VIDEO.DAT to root partition of your boot drive, that's usually
C:\. Reboot. When u will now want to change resolution in TOS, Centscreen
will popup dialog with all your saved resolutions to pick. You can also
setup virtual resolution, method of scrolling, screen blanker, energy star
etc...

Centvidel:

After u have Centscreen active, u can run CENTVIDL and u will be able to
setup your own resolutions. Basicaly u need to do compromises betwen slow
refresh rates and size of screen. Having good multisync monitor helps a lot
since u may use higher horizontal refresh, and thus higher resolutions at
reasonable vertical refresh rates. Use of "REAL TIME" switch is
appreciated, since u follow changes on the fly... However, if u don't trust
your old monitor, switch RT off, especially when switching to higher Clock
(videl frequency - 25 or 32 on stock Falcon, 50 on CT2/CT60 with bus
accelerator) and find settings which your monitor can display, before
switching RT on, for fine tuning. U will see horizontal and vertical
frequency change, so just set resolution so that they will fit your monitor
range. If u manage to get your monitor to collapse, don't panic, just hit
the UNDO key. Save resolution or resolutions to video.dat file. Hint: name
them with names u will later recognise easily :)

You can get 736*560 in 16/256 colors on plain Falcon, or even 800*608, but with a bit low refresh rate using 32mhz pixel clock. On CT2 (or CT60 with 25mhz bus) sensible resolutions are 928*704 in 16/256 colors, 736*544 in TC etc.. U may of course set even higher resolutions, but horizontal refresh will drop...

NOTE: CT60 users need to use patched Centvidel, since normal version can not detect Videl frequency.

Videmod:

With VIDEOMOD you select default resolution and its settings. This is very handy for MiNT/Magic users, since no TOS dialog is shown are resolution change, but Centscreen just switch to default resolution. So pickup prefered resolution for each bitplane depth, set paramaters (screen blank time, screen switch off time, size of virtual screen, VS scrolling method and save settings. Now each time u will switch res in MiNT (N.AES or XaAES paramater) or Magic, selected resolution will be used. U can also use Videomod to set temporary resolution (click APPLY without saving) if u are in need for other resolution.

Hi David
Thanks for your reply. Its just the kind of thing I need -
practical pointers to set me off in the right direction. I've found
some more info and a useful article in "Atari World" October 95.

> Normally you would use the SCC-based ports for speed and Serial2 has
> the most control lines. You need HS Modem to take advantage of the
> speed.

Yes I have it.

> yet to determine, not as quickly as STiK.

Looks like Magicnet needs long file name support for it to work. I'm
looking
for the easiest set up to start with so I'll try Sting.

Having said that there may not be any easy way. I have found my old Sting
setup files and its coming back to me now. Getting a working "DIAL.SCR"
script for the ISP was / is the hardest part. I never could get it working
again. I hope to have better look this time.

> board.
>

Well, I already have considered this one socket and I think it would be
the best and definitive solution if the pcb/epoxy part of it could be
made larger and provide with HE-10 pin-headers for a daugther/expansion
board like mine. I could make a drawing if not clear.

Of course one would need to remove the old PLCC-68 socket and solder
this new one in place (delicate phase) . If you put back the 68000 into
this socket, you get back to the original MEGA STE.

Michael, do you recall how many extra connections other than to the
68000 itself, the Magnum or other cards required if any ?

As far as my design is, I needed to pick-up three ones on the motherboard:
- DMA_INTRQ for IDE ackowledges
- XAS and XDTACK in a MEGA STE because they are hidden by the
cache+16Mhz controller. I need them in order to anwser to the blitter
when it tries to access the FAST-ROM/TOS or the FAST-RAM of my card.

Zufaellig, do you know if someone has the sources of these Atari's GALs
to control the cache and 16MHz ? These "black boxes" give me headache
and if I am now successful with running 16MHz + Cache + Blitter, it is
not 100% reliable. I know these GALs where not protected on the really
first series of MEGA STE presented to the press, so....

Thx
Fred

I don't know the Stacy insides, but could it be a fuse? If this
has been dislodged, you won't get any power! If it is one, it sho
uld be in a clip or possibly spot-soldered to a pair of pads, t
hough you say you can't find any empty soldering islands (could
it be connected on the other side ?).

The standard advice, which always worked for me, was to dial your ISP and watch the dialogue that ensued on a terminal emulator. I usually used the VT52 accessory that came with early STs. You construct your script to look for the ends of the question/prompts and then supply the answers. However more recently a script has usually not been necessary - just your PAP id and password set correctly.

Message-ID: <zjEde.3508$BE3.2855@newsread2.news.pas.earthlink.net>
Source record: 13631

All,

I have a 1040 STF (I think 1 MB, but won't swear to it) with an AdSpeedST,
SC1224 color monitor and the following games for sale:

Defender II
Greg Norman's Ultimate Golf
Dungeon Master
Chaos Strikes Back
Super Sprint
Microprose Golf
Stellar Crusade
Nine Princes in Amber
Ogre
Red Lightning
Steel Empire
Dominium
MegaTraveller 1
Just Another War In Spaqce
Risk
Sky Chase
Arkanoid
Sundog - Frozen Legacy
Omega
Star Quake
Hoyle's Official Book Of Games Vol 2: Solitaire
Space Rogue

And a box for the floppy disks. Nearly all of the games have their original
boxes and were adult used. This system has been sitting for a while, but I
was able to bring up Steel Empire at 16 MHz last week without a problem.
There's no box for the SC1224, and the 1040 STF is in a 1040 STE box with
no manuals for any hardware.

$50 or best offer for the package. I'm in the Dallas/Ft. Worth, Texas area.
Email or 817-427-2129.

I have no STE here to check, but the ST boards used uncommon PLCC sockets with staggered rows - most PLCC sockets you can buy today have the two pin rows lined up. If the STE has the same style of sockets as the ST, then your proposed socket won't fit the holes on the STE PCB.

However, if you are willing to remove the original PLCC socket, I would recommend to solder SIL socket strips (a single line of machined contacts like on DIL sockets) onto the STE board, so it looks like a PGA socket with staggered pins.

You can then put SIL header strips on the bottom of your expansion PCB, like these:

http://www.harwin.com/include/downloads/drawings/D01-992.PDF

Your PCB would then have a normal PLCC socket on top - either a SMD socket, or a throughhole socket offset to the side from the position where the header pins and from the bottom side. This is really a pain during installation, but gives a mechanically stable connection, and you can always plug the original Atari PLCC socket into the SIL strips that are now on the STE board.

>Michael, do you recall how many extra connections other than to the
>68000 itself, the Magnum or other cards required if any ?

The MagnumST required only one connection for the ROM CS signal, and only if you wanted to use the TOS 2.06 sockets on the MagnumST - the memory expansion worked without. The MegnumSTE required no extra connections, but I am not sure if there were signals that were not wired through between the CPU socket and the STE board.

(The 36MHz Magnum pictured at
http://heisenberg.ccac.rwth-aachen.de/~michaels/images/MagnumST-36MHz.jpg
which only existed as a prototype definitely needed to cut some signals

between CPU and ST board, to route them through additional logic, as can bee seen on the photo).

cu

Great idea! I'll be a happy member, Enrico -- cept you forgot to post the
url. I haev a few MT32-based MS files that I did back in about '88-'89.

There are a few software only Backup Systems for the ST.

A Copier, and Pro Copy come to mind.

Both are fairly old, but will backup some disks.

Not sure if there is a Atari Web site devoted to Software
Backups.

Sorry to burst your Bubble, but I checked CentVidel. I'm running
800x608TC in
a non-interlaced mode. The reason I said Might be interlaced is, I
remember
experimenting with several modes interlaced and non-interlaced.
I wanted to go back and check to be positive that it wasn't a interlaced
mode
as I knew someone would have something to say about it.

> That is possible with SB2, videl at 60hz and REALLY lousy display,
> some 40hz refresh in inrterlace, giving u 20hz refresh.. And u need

>

I'm not exactly sure what you are saying here about the SBII.
I think you mis-understand.

The 1280x960 in 256Colours is not a interlaced mode or virtual
mode and isn't slow at all. Remember that you can setup
different resolutions with the software. And when it comes
to higher resolutions, not all stock Falcons are the same.
The type of Monitor you use makes a difference also.
Even the type of system memory you use can come into
play in some situations.

IMO, even 1280x960 in 16 colours on a stock Falcon is much
better if you are touching up a picture or doing some Word-
processing or DTP work over 640 x 480 as you can put so
much more on the screen to work with. But everone has their
own taste.

> It is not that easy to find perfect overall resolutions, that would
> be nice to the eyes, wouldn't load sdma too much and be extreme big :)

> by
> resolutions only, but speedup entire system, resolutions are bigger,
> faster, hdd is faster etc...

I don't like interlaced modes at all and avoid them. You can get
very good NON-Interlaced modes out of SBII or BlowUp II on a
stock Falcon. Which are better or more useful than the stock
resolutions. And are not hard on the eyes. I've used SBII on
a RGB and a 17inch SVGA the VGA modes are rock stable
and clear up to 1280x960 and beyond. That's the neat thing
about em. You can try out all standard resolutions and if
they don't suit you, then you can make your own that fits your
eyes.

Upgrades like the Nemesis, CT2, CT060 and etc are nice.
But I recommend having a 2nd stock Falcon to use for those
programs that don't work well on the Upgrades.

>
>
> Its quite hard to choose :) SB2 has better hardware, and can achieve

> betwen virtual res and real res in moment. But betwen all res enhacing
> apps, my fav is Centscreen..
>
I like the GenLock mode on the SBII, not sure if BlowupII has that
as I've not fully tested it. But the GenLock mode isn't useful unless
you have a Genlock.

On the CT2B Falcon, I use Centscreen/CentVidel.
And on my stock Falcons I use SBII and or BlowUp II
software and hardware as they are faster than software
enhancer alone.

There was a good commercial RES software only enhancer
that went Freeware. I think it was called Videlity and it
has ScreenBlaster support. It would be a good one to
checkout if someone needs one. It looks very nice BTW.

First I'd give the power board a second look. If it's not fitted firmly in
it's socket, you could end up with the symptoms your STacy is having.

Regards,
Martijn

Hi Chris

Many thanks for the reply

> What happens if you try to format a floppy ? does it fail on the same
> place, or random places ? Have you tried any memory testing software ? Bad
> cables ?

I'll try out your suggestions when I have a moment at the weekend. As for memory testing software I'm a little stuck. As for memory testing the unit has a hard disk but will not boot from it... so I'm looking at the floppy as the source for software at the moment.

all the best,

Mark

Source record: 13552

Hallvard Tangeraas a ï¿½crit :
> Any progress or news on the IDE/memory interface projects?
> I'd love to add this sort of functionality to my machine(s).

IDE is working fine, I am using a 512MB compact flash from Sandisk as
hard disk and achieved these transfer rates in PIO mode 0:

CPU @ 8MHz : Read= 1.3 MB/s Write= 1.2 MB/s
CPU @ 16MHz: Read= 2.0 MB/s Write= 1.7 MB/s (153%)

I still have important stability problems with
cache/16MHz/Blitter/Fastram combinations but was able to run Kronos for
benchmarking :

CPU @ 8MHz, no blitter, no cache:

ST-RAM --> CPU: 2.3 MB/s
TT-RAM --> CPU: 2.4 MB/s (strangely not that faster, is the bench
itself running in fastram or not?)

CPU-->ST-RAM : 1.4 MB/s
CPU-->TT-RAM : 1.5 MB/s

CPU @ 16MHz, no blitter, with cache:

ST-RAM --> CPU: 2.4 MB/s
TT-RAM --> CPU: 3.1 MB/s (129%)

CPU-->ST-RAM : 1.5 MB/s
CPU-->TT-RAM : 1.9 MB/s (127%)

These are preliminary results, some further optimisations to come.
I also want to find an other benchmarking software for comparison
because I suspect Kronos to be slowed down by the ST-RAM in all phases.

Hi

Iï¿½ve got power!
The problem with the Power Board is that it does not fit completely,
since the ICD enhanced chip is slightly higher than the 68000, which,
in turn, means that the Power Board slides of one of the sockets.

I have to refit the component on the harddisk, since my only working
version of Emagicï¿½s Logic 2.5 is located on this! (The original disks
are malfunctioning).

If i do not succeed in getting the HD up and running i would
appreciate if some kind fellow user would
zip up the original Logic v2.5 files and send them to
fedder@webhiker.dk

Thanks
Peter Feddersen

Bill, I'd be glad to receive any kind of contributions, being it new music files or versions of the program. BTW, I'm still looking for Music Studio 88, don't you happen to have it? (I have the Atari, ST, Apple2gs, Amiga, Commodore versions so far).

The url for the site is:

http://www.themusicstudio.tk

it's still under development, though.

Great idea. I wasn't aware there was a '88 version (so I don't have it...)
Please keep us informed with the webiste!

Cheers
Simon.

Great news!
I hope you succeed with the 16/8Mhz/Cache issue as well.
Which solution did you go for regarding the PLCC socket?

I am currently using the same kind of adapter as shown on a previous
link given by Michael Schwingen:
http://www.cabgmbh.com/deutsch/downloads/elektronik/pdf/D_42_01_03.pdf

Mine looks like the right pictured one in the pdf file.

I shall check my mainboard but I can already believe him when he says
the PLCC sockets in the Ataris have staggered pins so I have to find an
other solution and probably follow his advice with single-in-line pin
headers at a reduced pitch of 1/20" I guess.

Atari's don't have chunky mode in 256 or 16 color modes... VNC can only be used on hades or ataris with gfx card in those modes, for falcon, 16bit mode is chunky, others use bitplanes.

So this socket plugs into the (empty) PLCC socket on the STe, and
is soldered on the underside of the IDE board?

> I shall check my mainboard but I can already believe him when he says
> the PLCC sockets in the Ataris have staggered pins so I have to find an

I'm not sure I understand (probably because I haven't had the
chance to take a closer look at the moment), but why doesn't your
current solution work? I certainly want to avoid removing the
existing PLCC socket on the STe/Mega STe motherboard if I can get
away by simply plugging an IDE board directly into it, and from
what Michael has told us, that socket solution should work fine.
The Magnum STe board didn't need the Atari STe/Mega STe PLCC
socket to be removed, did it?

It does - exactly like the MagnumSTE did it. Hiwever, there is the problem
of mechanically stabilizing the add-in board - the connector alone does not
provide good stability for large add-in boards.

Click on drive A, select the "install disk drive option" in the outer
right menu, enter the drive letter of your ramdisk and select "install".
Now an icon for the ramdisk should appear. Doubleclick it to verify that
it is your ramdisk.
Save your desktop to make the icon permanent.

I'm currently using my meager skills to try and setup a personal web page. I was just wondering, is there a free and open source for Atari related pictures, icons, etc? I googled but the results were poor at best.

Its easy as all get out to just save some of the cool looking graphics from current Atari web pages but I wouldn't want to take/use something (that somebody else had worked their guts out on) without their explicit permission.

Thanks everyone.

'88 was a nice upgrade. It had the ability for an author to change
tempo, volume, and/or sounds (midi programs) in the middle of a song.

I won't be able to send you my songs for a while, unfortunately -- I am
in the midst of a TOS upgrade (read: unsolder old 1.62 chips and soldering
in sockets so as to be able to install TOS 2.06) and have been having
troubles with the unsoldering part. (*grumbles*) I need a better
desoldering toolset -- just got through researching some and found a
really nice one that I can't afford just yet by Hakko (a pistol-grip
desoldering iron with built-in pump *drool*)

Since I have just the one ST and it's the only one that can read the
song disk.. well.. *shrug*

One that I use on my 4meg STe is SI RamDisk.
It has preset ramdisk sizes to choose from and also a built in
printer spooler. I think it also has a few other goodies.
It's one of the best IMO, very stable.

I use it to copy .lzh, .arc and disk Image files like .MSA to. Then
extract the files to the RamDisk. It's much faster than doing it to disk
and if ya mess up, it's in memory and easy to erase.

Bill, have you tried removing the old chipset pins with a flush cutter? (to avoid overheating the mainboard and the old chip with a solder). BTW, thank you for providing info on MS88. The more I can get, the best the site will be. (of course I hope to get the hands on the program the sooner or later)

I agree with Edward in that Music Studio is great. I'm a dilettante musician, and I've been using many music notation programs. I like what modern programs have to offer (lots of functions, symbols, effects), but MS was incredible for its ease of use. It would have been nice if Activision would have updated the program instead of abandoning its developement.

Regarding the site, I'm considering implementing a "songs upload" section in my site for contributions, though I'm not yet sure if there will be enough use for it. :)

1706. ATARI 1997 STF with WLAN

Newsgroup: comp.sys.atari.st

Hi all!

Well, never thought about it, but then one day I did.
I just connected a Higarte Pocket LAN adapter to a little
and cheap D-LINK DWL-900AP+ Wireless LAN Access point
unit.

I re-configure the D-LINK to become a Wireless client
insted of work as a access point in the inbuild software.

The D-LINK with a IP of 192.168.0.7 and the STF with
192.168.0.8 then worked as two clients.

Of course I need and have a router with WLAN D-LINK DI-
614+, this router then talk wireless with the D-LINK unit
I connected with the STF, but...

...I can now move my 1997 ATARI around in my flat and
always have Internet on it. :-)

This perticular STF have TOS2, 4MB RAM and an internal
IDE disk with 240 MB, so I can use several Internet apps
and with its SM124 monitor it's not a big deal to move
around from my kitchen to livingroom or elsewhere at
home.

Nice, eh?
A Classic ATARI with WLAN.

Mille Babic

Installing FreeMiNT is easy, as FreeMiNT is kernel only :) But installing EasyMiNT distribution is also not hard, just take time. Its basically just sit and wait procedure...

I used cable modem with TT from 1998. Interesting part is, that TT is equiped with Riebl ethernet card, MiNT and it was running as internet (ftp and www) server and as gateway machine (mintnet and ip masquarading) for my Falcon (PLIPed to TT) and MST (midi net). Except Falcon, all is dated 1991 or less, so LAN with ethernet on genuine Atari hardware :) PLIP is not that bad, after i installed CT2 on Falcon, speed went up to 120kb/s in good days, but it was arround 80-90kb/s constantly (kilobytes, not kilobits).

So Atari did have ethernet in time :)

1709. GAL chip for MegaSTe HD floppy

Newsgroup: comp.sys.atari.st
Date: 2005-05-08 16:13:33 UTC
From: Hallvard Tangeraas <inv@lid.email>
Message-ID: <427e3aaa$1@news.broadpark.no>
Source record: 13586

As I have a Mega STe I know that it has support for HD floppy drives. Unfortunately mine is an early Mega STe, so it doesn't have support for out of the box, and thus needs to be upgraded.

I followed the thread a few weeks ago about this very same issue, but as usual it escalated into a discussion about the WD-1772/AJAX disk controller issue. However, I did understand that what I need is a differently pre-programmed GAL chip (location U-407).

Is it possible to copy GAL chips? If so, is anyone with a MegaSTe and this GAL chip willing to program a blank GAL chip for me with that data on it?

It's been several years since I looked into this issue, but I do seem to recall that there was more to it than just changing the GAL. Some soldering perhaps? Other chip replacements?

1710. [ANN] Lynx C devkit for AtariST (0.1.0)

Newsgroup: comp.sys.atari.st
Date: 2005-05-08 18:06:00 UTC
From: Pierre TON-THAT <geek@atarians.com>
Message-ID: <427e5508$0$26072$7a628cd7@news.club-internet.fr>
Source record: 13587

Bonsoir :)

Download from my homepage (at bottom). This is not a GEM program, but
a suite of TTP for Atari Lynx development, with C language.

-> Lynx C devkit on ST, version: 0.1.0
This files correspond to the lastest 42Bastian's newcc65 suite.

Use:
- with MCMD.TOS (command line interpretor of MagiC), or bash under MiNT
or any CLI
- please study the text (.c .h .bat .mak) files.
- change the CC65LIB and CC65INCLUDE paths in compile.bat
- launch make_gfx.bat before compile.bat

See the examples. The .LNX final file is a cartridge image for the Lynx
emulator called Handy.

Planned:
- the TTP to send the datas to Lynx memory via BLL (.o file) or the
Karri's flashcard.
- rewrite of some TTP, in GFA or for PureC, for small and quicker TTP,
that uses less the hard disks and memory.
- a frontend in GEM (text editor, shell, sprite editor).

Voilï¿½ :)

I also have a early Mega STE1. It came with TOS 2.05 and a 720k floppy. It also has the DMA sound bug. I did check and I have the WD-1772 in it but I should also check to see what GAL I have. Where is it at and near? I upgraded it to 4MB and TOS 2.06, and wish to install a Epson SMD 300 drive I have sitting here (Which is a exact drop in replacement) I have not tried it, what happens when the GAL needs to be replaced? Does it not work at all or does it work but has problems?

Thanks
Tim

DMA *sound* bug? Never heard of it.
I know that some early STe (not Mega STe) machines were equipped
with a faulty DMA chip which caused hard-drive problems, but
didn't know that this also affected Mega STe machines.
Or are you referring to something else?

Are not two issues getting confused here? Upgrading the disk drive is
mormally a matter of a new drive, and AJAX chip and setting the
configuration switch which enables HD.

The GAL is required for addressing a 68881/2 if you fit one.

Unless I am mistaken, the AJAX chip controls the Floppy Disk Drive
in the Falcon and maybe something else.

Alas, I don't have a Falcon Field Reference Manual which I really need.

Some one correct me if I am wrong about the AJAX chip controlling the
Disk Drive. And if it has anything to do with the SCSI system or
something
else, I need to know that.

I have a extra Falcon AJAX Chip here New in original Package.

If we could determine if that is the problem, I could get ya a used one
off a Falcon parts board here or maybe work something out for the new
one.

Reason I ask if it was stock, I think some Buffer upgrades and etc
modify this
chip with a wire. I was going to suggest to check it to make sure any
modification
to it hasn't came loose.

Also, for anyone in the know, is the AJAX chip in the Falcon, different
than the
one in the Mega STE that has the high denisity drive?

And will it work in a Mega STE?

BTW, the AJAX chip is a 28 Pin chip, located toward the back of the
motherboard on the right side. Not sure if its under the disk drive
but it's close to it.

Should have C302096-001A or similar right under the Atari name.

Are you referring to the jumper pad (or is it a DIL switch?)?
If so, the only thing it does is enable an additional "High
density" format option if using the TOS 2.06 desktop formatter.

On the ST/STe it's more than just getting a new drive. Most
drives have to be slightly modified (I've done it myself, and
documented it), and additional electronic circuitry needs to be
added to make it switch between HD and DD modes.

On the Mega STe however I'm not entirely sure, which is why I've
posted here. I believe I've heard that you can simply replace the
existing 720 Kb disk drive with a HD disk drive (it's unclear if
this means a *standard* PC type disk drive, or a special "Atari"
adapted drive, which was available from Atari dealers at the
time) and you're done (as long as the right GAL is available, and
of course an AJAX (or just the plain old WD-1772-02-02 if this
isn't going to turn into one of those 1772 vs. AJAX discussions
again;-)).
From others I've heard that you might have to solder a wire or
two somewhere inside the Mega STe, but I might be confusing
things for all I know.

> The GAL is required for addressing a 68881/2 if you fit one.

Yes, that upgrade needs a GAL as well.
But the Mega STe does indeed use a pre-programmed GAL for
high-density disk drive support.
It came with newer Mega STe machines, but not mine.

Switch 7 from memory. And you are correct. With a 1.44 fitted, most
formatting utilities will format at hd, regardless of the dip switch.
There is also a auto prog called hdcookie.prg (I think), and it installs
a hd cookie to enable hd formatting from the desktop. Does the same
thing as the dip switch.

You wanna;-)

As far as drives go, the only requirement is that it is set to drive 0,
not drive 1. FWIW, I would just plonk one in and try.

I have a MegaSTE, that was quite early, fitted with 2.05. It worked fine
after a floppy and TOS upgrade. One way to tell its age, is if a blitter
chip is present. The later machines had an integrated blitter, fwir.

Well I'm replying to my own post.... 8-)

According to the program (What Is It?)

That .SCR disk file is SCRUNCHED. (sounds like a Atari 8-bit
compression)
But its on a ST Disk.

Anyone know what program UN-SCRUNCHES disk Images into complete Disks?

Normally I'd forget it, But it's Alternate Reality!!!

Most of the disk Images I have are .MSA which I have the
program for.

And now I've ran into a disk file with a .MOB extender also.

Guess its back to What is it, unless someone here knows.

I recently got 2 midi devices.

Each box had 2 midi cables and each box has 2 Phone Line type Jacks.

I have no software or manuals.

Anyone have these that could supply software and maybe a manual
or a place to get em.

I use STing which I think supports them. But would like the original
software
if possible.

IINM, they can be used to connect 2 Atari STs-Falcons together.
But not sure if both boxes are needed or if it can be done with one.

Also need to know if normal phone lines work with these.

I did have an AJAX lying around, so before I upgraded my drive to HD, I first swapped the controller chip out. Everything worked fine, and as a test I put the WD1772-02-02 back in, and it worked fine also. SO... Ajax not required. I still have the AJAX in the drawer as a spare, and the MegaSTe is still fine whether using DD or HD disks. I do have TOS 2.06 though, and I can't remember what GAL version I have.
Its not possible to copy GAL's as far as I am aware, but I am sure the code for this GAL is available on the net somewhere.

Coda.

Well, I googled on "SCR" and got some wildly varied results.

According to what I found (and take all these with a grain of salt!),
it could be any of these:

script file
Sun raster file
Windows screen saver file

See what I mean? Really hard to tell Barry.

Just icons, logos, anything to do with Atari, the Fuji, stuff like that. :-)

Thanks.

1730. Atari stuff for sale in Dallas, TX, USA..

Newsgroup: comp.sys.atari.st
Date: 2005-05-09 19:51:06 UTC
From: John Jones <mbrunt@atyahoo.com>
Message-ID: <-eKdnWeQDNqEIuLfRVn-pg@comcast.com>
Source record: 13507

Hello everyone,
I live in Dallas, TX, USA, and I have some Atari stuff for sale. A few years back I decided to get an old Atari to play with, and somehow I ended up with more than I had intended. I'm sure you all know the feeling! Anyhow, shortly after acquiring all this, my life took a few different turns, and I haven't had the time I'd wished to play with the Atari(s).
Now i've finally taken them out of their storage boxes and am hoping to find good homes for them. I would like to find someone who can pick them up in Dallas, so as to avoid having to package all this bulky and heavy equipment.. but I know there's a fat chance of that, especially as the Dallas AUNT users group is no more! :(

Sorry, I'm long-winded. Here's the list -

- 520 ST
Rainbow TOS 1.04
AERCO easieST RAM upgrade, 2.5MB RAM total RAM
(Broken HELP key - it works, but will fall off. Missing "(" left paren key on numberpad)

- MEGA ST4
TOS 1.02
4MB RAM
Includes working keyboard

- SM124 Mono Monitor
- SC1224 Color Monitor

- Hard disk enclosure with ICD adSCSI-Plus SCSI host adapter, 44MB Syquest removable drive (incl. 2 disks) and 80MB hard drive
(I also have a non-working ICD Advantage-Plus SCSI host adapter - which AFAIK is an older version of the above but functionally the same. It was working when I first pulled all this out of the boxes, but I seem to have broken it. :(After initial successful testing, it started causing the Atari to bomb during bootup.)

- Spectre GCR Mac emulator (with Mac ROMs installed, and with some Mac software)

- Two functional Atari ST mice

If I can't find anyone who can pick them up in Dallas, I will consider shipping to interested parties.

To e-mail any offers, replies, or inquiries please use "mbrunt at yahoo.com". Replying on the newsgroup is fine, too, of course. :)

Thank you
Micah Brunt

They work withhout shielding! Floppy is basically standard part, so its
really just the keyboard you don't need, and with an Eifel you wouldn't need
that. I don't expect any one on here to have spare MBO Look on E-Bay for a
machine with a tatty case.

Microtech made some. I have one, not for quiet, but hoping that it can be made to read cards from an Atari Portfolio. Right now, it has a SanDisk Compact Flash to PC Card Adapter in the largest of its three slots.

I found one, and got it by bidding, on EBay, about three times what it is worth. I do not know yet if one of the other slots takes a CF card. I do know there is a CF card adapter for a Portfolio.

Titan released two genlocks, the cheaper was Graffiti and expensive was the Falcon only EXPOSE.

So you can use Graffiti with STE models without problems, only need cable for it, the ST's needs special interface to generate GENLOCK for SHIFTER signal, so in the docs there is how to install it.

> I do think I have a disk for it, I'll check.
> I have the cables as well.

Well I never run this genlock but im sure it comes with software, otheerwise how to use it???

I will send you docs quick when I made PDF.

I need also Falcon cable schematic pinouts. Could you do this ?

Will do Jim, and thanks! :-)

1741. Falcon and Ide drives

Newsgroup: comp.sys.atari.st
Date: 2005-05-10 21:03:14 UTC
From: fried.man@sympatico.ca
Message-ID: <1115758994.867886.273360@f14g2000cwb.googlegroups.com>
Source record: 13518

Hi there, I am trying to set up a compact flash drive on my Falcon, but I am confused about some basic things I think. If you disconnect the IDE drive on your Faclon, shouldn't the computer first look for an IDE drive, and failing that, boot from the first drive it can find ie the scsi drive. Also how are the drive or partition letters affected? And how do fix the partition order? I am using HD driver 7.61.

1742. [WEB] new snapshots and sources releases

news:BEA6B922.3C7A%vlg@o2.pl...

> Titan released two genlocks, the cheaper was Graffiti and expensive
> was the
> Falcon only EXPOSE.

I have the EXPOSE as well, It is a Falcon Colour Video Digitiser and
works with
Apex Media. It's not a Genlock as far as I know.

I have a small ST booklet that has various reviews of Atari ST-Falcon
equipment
It does mention the Graffiti and Genlock software but I can't remember
the
name of the other Genlock by Titan. (I'm looking for the book and will
Post
the Info when I find it).

BTW, I have another Genlock called the HAMA TRI-LOCK. It doesn't require
software. ANd works on any Computer! Atari, PC, Mac. It is a very nice
one
with a bunch of ports on the back. Was Expensive in the Day.
It can be seen in back issues of Atari ST USER and some of the other
Mags.

And I just purchased a Genlock for my factory Mega ST4, The JRI Genlock!
What a treasure!
Not received it yet but it's suppose to be on its way.

>

> Well I never run this genlock but im sure it comes with software,
> otheerwise
> how to use it???

Ok, I checked the software disk that I got with the Graffiti.
There is only one program on it called CLOCK.PRG.
It is only around 182 bytes in size.
It goes in the AUTO folder or you may be able to run
it from the Desktop.

I'm not sure the disk I got with the Graffiti Genlock was original.
It didn't have a normal production type label.
But did have in writting.....
Graffitti Genlock STE
Clock.prg software
The disk had a AUTO folder with the clock.prg inside.
And also the same clock.prg in the default disk directroy.

I can ZIP it and send it to you if you like.

I haven't really tried the Grafitti Genlock out yet.
I do have cables but would have to pull out the box to
look at em.

If you have cables with yours, describe the type of cables
you have. And I'll do the same when I pull out the box.

>
> I will send you docs quick when I made PDF.

Great, I really could use these.
>
> I need also Falcon cable schematic pinouts. Could you do this ?

Maybe, not sure what you really need.
Do you have a Falcon?

Not sure on this until I look at the Genlock again, But I think the
genlock has
a standard Atari Monitor cable connection. If so, It should connect to
the Falcon
using a Falcon RGB adapter. But again, not sure if it will work on the
Falcon.

I'll look at the Genlock and cables and post a update to make sure I
haven't
made a mistake on the Genlock port.

Source record: 13521

Can't answer all your questions.

But unless I am wrong, the Falcon looks at the 3 1/2 disk drive first,
then
goes to the IDE and SCSI.

Some Falcons came from the Factory without IDE drives.
I have a 1MEG Falcon here that doesn't have a IDE and I'm fairly
sure it came that way from the Factory.
On the bottom of the Case it has 1MEG and the Hard Drive size is Blank.
But it does have TOS 4.04 and looks the same as any other Falcon
mother board except for the missing IDE and bracket.
I happen to have a new IDE hard drive kit to put in it plus other
goodies. 8-)

Most Falcons are stamped 4megs and 80meg hard disk or similar.

I don't think the drive letters will be affected at all.

If you only have a SCSI drive, then the first partition letter
would be C: But it may be possible to change this if you
want or need to.

You could setup a boot floppy disk if need be.
Or simply put a blank formatted one in the drive
and let the Falcon boot from the SCSI.
I think it's possible to do this.

Remember the Falcon Mark I and II? IINM, they removed the
IDE and had internal SCSI drive.

If you remove the IDE, the Falcon should look at the SCSI
drive to boot from. But it will look at the Disk Drive first
If I'm not mistaken.

phantomm@bellsouth.net

Source record: 13523

TOS will look for IDE drives before SCSI drives unless otherwise told by the hard disk drivers. HD Driver allows you to set any drive to be the boot drive and also allows you to choose "on the fly" by pressing the proper partition letter at startup.

I have not done this for quite a while, but if you run the HDDriver tools you will surely find the proper tool for your needs.

Galen

1747. Re: Falcon and Ide drives

Source record: 13524

Tos will always boot from IDE first regardless of what the hard disk
driver says. Hddriver may re-direct booting to another drive/partition
but it has to *boot* first in order to do so. See what I mean?

Coda.

Source record: 13536

A little more info on the Graffiti Genlock.....

Pawel,

My Graffiti came with only one cable as far as I know.

I have 2 other cables for my Hama Tri-Lock that might work on
the Graffiti.

Anyhow, the Graffiti cable is black, like the Genlock box.
It has a 13 pin Round Atari ST type monitor cable on one end.
The other end is a 9 pin RS232 type cable end. Just like the
end on a Atari Joystick.

On back of the Genlock there are a few ports of course.
One is the 9 Pin Computer In port.
One is the 13 pin Monitor port.
There is a Female RCA port right above the monitor port,
and is labeled VCR.
And In the center of the ports is another Female RCA port,
labeled Video IN.

There's also the 12v DC power port.

With these standard ports, It can be connected up to the
Falcon. Not sure if it will work though.
I'll test, when I get some extra time.
I want to try it on the STE first as I've never used it yet.

There are 3 POTS on the front and a black push stick button.

I've looked in the case, It's similar to the EXPOSE Splitter,
Looks like all the major chips and parts are used in both.

The Label on the back states that it was produced in the UK
by Titan Designs LTd. in 1993.

Is this the same Genlock that you have?

I sent the clock.prg. Hope it gets to you correctly.

Send me the manual when you get it finished.

I'm still looking for that booklet that listed Titans Genlocks and
software released for them. Seems I remember one software called IMCON
or
something similar. But, I'm almost positive that 2 Genlocks were
mentioned.
And if IRC, the review read like the software and Genlocks had been

produced.

Anyone have info on any other Genlocks produced by Titan Designs?

phantomm@bellsouth.net

Barry, I did another search on Google and found this link:

http://www.atariarchives.org/cfn/09/09/02/0389.php

Its "Atari Explorer Online: 6-Feb-94 #0302", as stored by
atariarchives.org (thank goodness for them!).

Here is the relevant section:

Titan Designs Ltd. for 1994 has not slacked off of product design for
the Atari at all. Information reaches me from all sorts of people,
this time an old friend from California called me one night to talk
about the catalog he received from the UK. I asked him to send me a
copy and he promptly sent one out to me. In it I found reference to
items I had not heard about before, specifically, some items referred
to as the Graffiti and Fresco video genlocks, and the Expose
Digitizer. These products, as much as possible reflect their
commitment to "the entire Atari range of products, especially as we
ensure compatibility of all our products with the existing Atari ST
computers wherever possible."

This is good news, especially for existing ST owners, who like me,
have held on to their older machines because they did not have any
income to spend on new ones, or they were waiting to see what would
follow on to the Falcon030. For those of us who can't wait for a
"possible" new Atari computer in the volatile '94 computer market,
there are some decent Falcon030 enhancements that really put it past
the TT030, namely the Eagle Sonic, and Mighty Eagle Sonic cards.

These cards are available in the UK, (also through Titan) and may soon
be available in the USA from dealers like STeve's Software and the
other great guys out there. Some people have claimed that there is
only about a 143% increase in speed with these cards, but this may be
due to the benchmarks being run in STRAM, and with fast RAM, like on a
TT030, even larger speedups should be forthcoming. I won't quote this
as being gospel as I cannot verify any figures. Fast RAM and a 32MHz
clock rate should really do wonders with a stock Falcon030.

I am awaiting more info on the digitizers and and genlocks, but for
now I do have the price of the Graffiti genlock device which runs

about 153.15 UKP. (1 UKP = 1.50 US make it cost about $225.25.) Not bad. This one is designed to work with the ST/STe line, and as SOON as I get the info I will write up a press release for you all.

Titan also carries the Reflex graphics cards, which are now at lower prices, ~$250. These cards allow an ST/STe to use full page monitors, and overscan on existing Atari monitors. These cards have been for sale for quite some time, and I won't bore you with the specs, but they are definitely worth the price. OK, here is the Titan address so you can get more info, or if you are a dealer you can call them on product availability.

TITAN Designs Ltd.
6 Witherford Way, Selly Oak
Birmingham 829 4AX
UK

Tel:021-414-1630 Contact them!

Hope this helps some! :-)

Yes a fellow countryman of yours sells a cartridge which will allow you
to connect an IDE drive to your ST.

Very cheap too ..

Visit here: http://www.rsi.pl/paskud/

Description (in Polish from his site):

"Interfejs twardego dysku IDE
Pozwalajacy na podlaczenie dowolnego twardego dysku IDE do ATARI
Interfejs moze obslugiwac dwa urzadzenia IDE (twardy dysk, CDROM)
Interfejs podlacza sie w port kartridge'a z boku komputera
(nie wymaga ingerencji do wnetrza komputera)"

Or browse through www.atari-forum.com and look for "paskud"

Assuming you mean a an IDE disk, I think you would have problems finding a ready made IDE Interface. Mario Beecroft has stopped making them, so you would have to roll your own, and from what I see there are no "clear" instructions.

Dave.

Thanks for the info..
Great source of information.

I did a search just for Genlock in those archives and
found some interesting info on other Genlocks I didn"t
know about.

The Fresco, was the other Genlock that I couldn't remember the name of.

Some software was also suppose to be developed for these.

Not sure what it was suppose to do as most Genlocks
don't need software to work.

However the Graffiti, does have a small Auto folder Clock.Prg.

(I'm still searching in my tons of Docs for the Genlock(s) review).

If anyone does have the software for Fresco and Graffiti by
Titan Designs, Do contact me and or post some info about
it here.

1781. IB DRIVE for ST/STE

Newsgroup: comp.sys.atari.st
Date: 2005-05-14 22:19:56 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <pJuhe.28365$yq3.16374@bignews1.bellsouth.net>
Source record: 13458

I've been experimenting with a IB Drive on my 1040STe 4meg.
It's a 5 1/4 Floppy Drive that connects to the ST/STE just like
a normal 3 1/2 external drive.

It works quite well and will read DOS 360K floppys.
Not tried anyother densities but I know it won't read the
1.2meg Floppys. (I've tried)

I was wondering if there is anyway to format a disk either
on a Atari 8-bit 1050 drive or the IB drive on the STE that
would allow me to transfer Atari 8-bit files to the STE with
the IB Drive.

Is there a compatible floppy format for this?

Or program that will allow this to work?

I'd like to be able to also transfer ST files to the
Atari 8-bit by writting the files to the IB drive then
reading them in a Atari 1050.

I have other devices to transfer the files, but would like to
do it with the IB drive if possible.

This is almost the same issue as transferring disks between an Atari 8-bit and a PC, and even worse. You will have better lack installing a 5.25 drive on a PC.

If you have a Happy 1050, then it can read/write standard DOS/ST 180k disks. So you don't need anything special at the ST side, except to format the disk at the ST as single sided. Other 8-bit drive enhancements have similar features but I'm not very familiar with them.

If you have a Discovery Cartridge for the ST, you can access 8-bit disks disk in any density.

Otherwise youll need special software for accessing 8-bit disks at the ST. AFAIK, it doesn't exist.

Note that in every case there are some limitations/problems. An ST cant access single density 8-bit disks. Because of the difference in drive rotation speed, you might get read errors. Most PC (ST) drives cant access the flippy side of the disk. The Discovery Cartridge solution overcomes all these limitations except the last one (because the flippy issue is a drive issue, not a controller one).

On the PC the situation is slightly better. Some PCs can access single density (FM) disks (no stock ST can). But what is more important, there is already software for accessing 8-bit disks.

1783. New XaAES development snapshot

Newsgroup: comp.sys.atari.st
Date: 2005-05-15 11:21:43 UTC
From: GokMasE <gokmase@gmail.com>
Message-ID: <1116156103.615891.253680@z14g2000cwz.googlegroups.com>
Source record: 13460

Hi all,

Following the alpha release of May 4th, we have now uploaded a new development snapshot that cures some of the problems that were present there. In addition to that, some other things were taken care of as well. This should be the most stable XaAES build this far!

Most significant changes:

Support for resource files that does not follow documentation, previously causing XaAES to not detect all CICONs at times. (zBench & rscview are two of them)
Update lock (aka screen lock) should not stop mouse-events (move/button) from being delivered. As a result of this XaAES is now a lot more responsive under such circumstances (most noticeably with AES-lupe)
Fixed a problem where wind_get(WF_TOP) would return the handle of the popup window during menu/popup navigation. This cures problems with Everest and ResourceMaster.
ARROW-up when at first entry will wrap to last entry, and ARROW-down when at last entry will wrap to first entry in the fileselector.
When typing in the inputfield and a partial/full match of a directory is indicated, entering this directory by pressing enter will now clear input filed. Allows for easier keyboard navigation. Need feedback on this issue!
Aniplayer 2.22 didn't respond to keypresses, should be okay now
Much better/stable menubar swapping
Much better/stable swapping of desktops
Check for, and attempt to remap, conflicting shortcuts in AES objects loaded via rsrc_load()
Bugfixed shel_write(), so that correct defaultpath is set for starting programs. (Fixes "TOS selfextracting archive extracted to wrong place" bugs)
Keep button-waiter until all mouse-buttons are released. This fixes problems with SoundBlaster Milan.

Download the new package at the un-official XaAES page:

http://xaaes.atariforge.net

(Don't hesitate to direct any kind of feedback to the form found on the URL above!)

Regards,

Joakim

1784. PC utility to read Atari ST (520STFM) distettes

Newsgroup: comp.sys.atari.st
Date: 2005-05-15 15:49:06 UTC
From: jp <ft00mch@hotmail.com>
Message-ID: <SbKhe.32385$G8.3209@text.news.blueyonder.co.uk>
Source record: 13461
Cross-posted to: comp.sys.atari.st,comp.sys.atari.st.tech

Hi All,

Anyone know of a utility that will allow me to read some old Atari ST diskettes?

I have loads of Single Sided and Double Sided disks, I vaguely remember that the ST format was different to that of a PC.

Will any 1.44MB FDD be able to read the disks?

Ta muchly for any assistance you can give.

JP

Message-ID: <a3Mhe.34524$yq3.27205@bignews1.bellsouth.net>
Source record: 13462

Thanks for the info.

I have 2 Happy 1050's and 1 ICD US Doubler 1050.

Also have a Happy Discovery Cart for the ST/STE. The big one.

So if I use the IB Drive with the Happy cart it will read just
about any Atari 8-bit disks?

There are many utils out there - the majority being DOS-based but there
is a Windows one called wfdcopy.

DOS ones: Makedisk and Disk2FDI (ST reading works in the shareware
version)

However, if you're running WIndows XP then you will face a few problems
as it doesn't allow the same kind of low level access needed by these
tools.

That's why I ended up getting a Windows 98 machine - for reading in disks
and for Ghostlinking files to/from my MegaSTE that I couldn't re-create
under DOS/Windows.

Yes, but not with the built-in software. You need software I wrote specifically for this purpose a few centuries ago. It was distributed in the Happy BBS, and I've seen it listed in some public domain compilations. If you can't find it I will try to search my backups, but I haven't use that software for ages.

I dont recall the details but the software has some limitations. It can't access the flippy side, not even when you are lucky to have a drive that it can. It can't access double sided disks either (as formatted with a XF-551 or a Percom drive).

Hi!

By mistake I missed a set of postings to this group - which I'd like to get back.

Searching the net all I found was google-groups or thelike, but it's not that easy to convert HTML-Threads to mail-INBOX-folder format (does anyone know about a tool doing this?).

Do you have an idea where to look for a group archive in "raw" format?

Regards,

Alexander

Hi, Chris!

e> Why not just copy and paste them into a E-mail and E-mail them to
e> yourself ?

I am talking about some 200 postings - it would probably take some time to
do so. Additionally I'd like to preserve the thread structure and correct
dates and such metadata.

Regards,

Alexander

Hi,

I'll look for it.

Ok, I have a few Happy programs. But don't think I have that one.

Do you remember the name of the software?

If you could check your archives for it and any other Happy
Discovery Cart software, I'd much appreciate it.

Also any docs or tips in text format or etc.

Thanks,
phantomm@bellsouth.net

Is there a way I can make my Mega STe (TOS 2.06) load TOS 1.62
from file (or other, older than 2.06 versions)?

"SelTOS" doesn't work with TOS 1.62 image files.

> diskettes?
>
> I have loads of Single Sided and Double Sided disks, I vaguely remember that
> the ST format was different to that of a PC.

The ST double sided format was not different from the PC. It was the same format, but there are a few differences. First the media byte from the boot sector was not present in the first byte of each FAT. And the PC checks for the start of the DOS bootloader. I wrote the bytes EB 34 90 in the first 3 bytes of the bootsector and the PC was able to read my Atari disks.

You can get a tool, which converts a double sided ST disk in the way, that a PC can read it from my homepage www.mbernstein.de (its german).
Go to the download section, then to atari and then get st2dos.

With some windows versions (nt4, w95?) i dont need my tool. This windows versions can read ST disks. With XP i have seen some problems to access DD disks.

With single sided disks i exprect problems to read them. I think, DOS and Windows could not read them because DOS and Windows dd never use this format. And DOS and Windows are to stupid to use the information about the disk from the bootsector. This is also the reason why DOS and windows dont read other than standard TOS disks (e.g. hyperformat).

> Will any 1.44MB FDD be able to read the disks?

Any 1.44MB Floppy can also read a 720KB disk.

The name of the program was "DiscLink". I don't have any docs besides the ones included with the distribution (which I guess was in ARC form).

Found the following with Google:

PST297 DISCOVERY UTILITIES - Copy 8-bit disks on your ST using the Discovery Cartridge ...

This is surely my program. Searching my backups will take a while.

Yes, I have more software for the cart. Most of it is much more "modern" than that one. Most of them will eventually be released as part of the Pasti package.

1799. Falcon scsi to ide

Newsgroup: comp.sys.atari.st
Date: 2005-05-17 12:09:05 UTC
From: fried.man@sympatico.ca
Message-ID: <1116331745.183184.61140@g14g2000cwa.googlegroups.com>
Source record: 13476

I guess this would apply to TT and ST. I have been trying out a SCSI to IDE adapter on my Falcon. This allows me to use an IDE drive as a SCSI drive. The adapter I got (on EBAY) is an Acard "AE 7220 U".It has a 50 pin connector. I tried it on some drives I got out of the trash, and it worked. I haven't given it an extensive test to see if it causes problems.
One place you can buy one new is Microland electronics. Google it and search for SCSIDE adapter.

1800. DarkForce! update

Date : July 2nd & 3rd

G�teborg (SWEDEN)

The web page : http://www.sak.nu

For more infos, contact : Mille Babic

The map : http://www.gulasidorna.se/kartor/

To see the NAS location :

In the "Gatunamn/plats" field, just enter B�ltgatan and G�teborg in the
"Kommun" field

When you search for planes to G�teborg (Gothenburg).

There�s cheap flights to Gothenburg.

There are several low cost airplane compagnies like RYAN AIR that may bring
you for 15 to 40 EUR !!) :

Check this with all low cost compagnies :
http://www.belvedair.com/en/index.htm - put the cursor on the city on the
map...

Two small airports :

- S�ve : is a smaller airport but within the city.
http://www.goteborgairport.se/eng.asp

- Landvetters : is an airport out of the city (South East).

PS : I will come to this NAS !

Rodolphe

Hey gang. Hallvard (you're still on here somewhere aren't you?) used to maintain an FTP list for Atarians.

I've got it on my BBS, I believe the last version I'm using is dated from something like 1999 or so. If I remember correctly, I did get permission from him to use it, as long as no changes were made (banner intact, etc, etc).

Does an updated version of this list still exist?

Thanks! :-)

> Does an updated version of this list still exist?

Nope. Haven't updated it or my Atari pages for years, and don't
plan to either.
I don't think there are many FTP sites left -most of the sites in
my list are closed or don't have an Atari section any longer, so
you'll probably be better off making a new one.

1811. Highwire 0.2.5 - Modules!

Newsgroup: comp.sys.atari.st
Date: 2005-05-18 21:38:36 UTC
From: neil@adel6.freeserve.co.uk
Message-ID: <d6gcks$p75$1@newsg3.svr.pol.co.uk>
Source record: 13488

Hi All

I have found that I have mistakenly deleted the "module:" entry on the "about" dialog box on the newest version of Highwire - with no obvious sign of getting it back again!

All the Modules remain in the Module folder but Highwire does not seem to want to load the Network.Ovl even after a reset! Also I have retrieved a fresh copy of Highwire.app from the distribution archive but even this reports "modules: (none)" now.

How do you get the online modules back?

The Config file doesn't have any options for the Module so where does it get configured from?

Also the Iconnect Ovl doesn't work with the latest version of Highwire, any answers on this?

Thanks

Neil :-)

You are very welcome to Gothenburg and I hope this makes owners of the ct60 to do attend as well.
I can tell that a weekend those summerdays in Gothenburg is quite something for you as for your own family.
http://www.goteborg.com/default.aspx?id=528

Nature will show of their working EtherNat aswell and most of the bord members from The Swedish ATARI Asscociation will bring their classic ATARI equipments.

We have lots of tables at the convent, so we really hope that all of you come to us and bring your own computers. Why not you with ct60 fitted.
Theres a huge LAN with a Internet connectivity, so your computers will have most of the possibilites you have at home.

Very welcome

Mille Babic

1813. Pasti St Imaging Tool released

Newsgroup: comp.sys.atari.st
Date: 2005-05-19 05:19:17 UTC
From: Jorge <user@nospam.com>
Message-ID: <d6h7kl$v5i$1@blue.rahul.net>
Source record: 13490

PASTI

Atari ST Imaging and Preservation Tools

Pasti is a package of software tools for imaging and preservation of Atari ST software. The two major components are the imaging tools and the emulation helper tools.

SOFTWARE PRESERVATION

Our main goal is the preservation of Atari software in its original unmodified form. Original software is normally stored on diskettes with custom format or copy protection. Standard tools cannot back up or image them. But floppy disk recording have a limited life time. It won't take too long until all original Atari disks will be damaged and lost.

TOOLS

Pasti ST is an imaging tool that produces disk file images of any ST disk. It runs on any ST computer, with the only requirement of one double-sided drive. Pasti ST needs a standard 8Mhz ST CPU. It doesn't run on TT or Falcon computers.

Pasti images can be used on ST emulators using the emulator helper tool, Pasti.Dll. The DLL is currently supported by latest versions of Saint and Steem. The emulator helper tool was released some time ago.

Both tools are now available at our web site: http://pasti.fxatari.com

Note that both tools are yet in the beta phase.

I use the Yamaha SCSI converter, available for about $10/euros on ebay.
It was designed for IDE CD Writers attached to the SCSI bus, so I
expect that this would work with a DVD writer too. I have tried it with
IDE hard disks on a Stacy, MegaSTe and TT, and it works perfectly.

Coda.

Has anyone heard from Egon Spengler lately, or even know him?
He had several posts here, mostly regarding hardware issues, and
I've we've mailed back and forth as well, but I haven't heard
from him for almost 1 1/2 month, so I was wondering if anyone
knew his whereabouts?

Tried about 5 times over half an hour - couldn't get through.

Sure would like to look at your software though. I've got lots of old ST games I'd love to have safely backed up.

Thanks!

Neil,
I think I did the same thing you did by going into FILE / INFO then clicking on the middle ABOUT button. Then I clicked on MODULES and it brings up the active ONLINE MODULE. When you click on the check mark next to it says NONE. Now upon closing HIGHWIRE down and restarting HIGHWIRE it reactivates the MODULE of choice and your good to go. As far as your problem is concerned. I would say as long as there is a HIGHWIRE folder with a MODULES folder inside of that and you have activated the online module of choice by renaming the file NETWORK.OVL you should be good to go. Highwire as far as I know does not care where it is on the hard drive as far as partitions are concerned. Anymore questions let me know.

Thanks,

If you mean to make an image of a floptical disk, then no, no chances.
Perhaps I should have said "of any *floppy DD* ST disk". But I thought it
was obvious.

If you mean to use a floptical as a hard disk, and write the image file to
the floptical, then it should. I didn't try anything expect a standard
hard disk or ram disk, but I see no reason why you couldn't use another
device.

I use it every days with no problem under Magicmac.

I also have in the past several crash with Highwire+Iconnect
(and with all the sites) and I found that this couple was hyper sensitive to
the adjustment of the MTU.
That even made me crash MacOS too .....

Then tests other values of MTU in Iconf.prg, default value must be on 512,
in my conf I spent 1492 for MTU value and that made an end to my superb
crash of highiwre.

I don't know if this will work on a TOS 2.06 MSTE, but
on my 1040STE with TOS 1.62 I use to load up older
versions of TOS simply by putting the TOS disk in
the drive and cold boot.

This worked on the old Disk version of TOS.

I have a MSTE with Tos 2.06 as well. If this works or you
find a way to do it, let me know.

I'd really like a few TOS switchers for a 1040STE and a
MegaSTE.

1827. Re: IB DRIVE for ST/STE

Newsgroup: comp.sys.atari.st
Date: 2005-05-19 17:27:59 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <zW3je.437$lQ3.144@bignews5.bellsouth.net>
Source record: 13404

I Setup my Happy Cart on my STE with the IB Drive.

I have a bunch of different Happy Backup files and programs.

Any way, I did find a back up file for Atari 8-bit disks SS and DS.

There were options for Comodore, MAC, apple and just about any
format you can think of.

I tried copying a 8-bit disk using SS and Floppy to file mode and
it copied it first time to the internal ST 3 1/2 disk!!!

I ran out of time and didn't try the Floppy to Floppy mode, or the
DS option. Will soon.

Looks like I have a simple way to tranfer those 8-bit files.

Without doing a bit of research, I'm not sure if the IB Drive is
a 720K drive or what.

Anyone know??

Also, I use to have a PC 720K 5 1/4 floppy drive that you could
connect to the ST with a Cable.

The Cable was homemade and some of the wires on the Drive
connection end came loose.

Anyone know a Source for making a ST cable to PC 5 1/4 Drive?

And can one use a High Density PC 5 1/4 Floppy Drive? Since the
MegaSTE supports HighDensity Drives.

Also, if anyone has a High Density ST drive kit for a 1040STE for
sale/trade do contact me.

I am going to check out the software asap.
Sounds interesting.

However there is another device or two that does basically the
same thing.

The Happy Discovery Cartridge (If you can find one).

This cartridge will take any Atari ST disk and back it up into
a IMAGE file that you can then store on a Hard Drive or CD/DVD.

And it will also do the same for any format, including PC, Mac, Apple,
and I'm fairly sure 1.44meg disks are supported but need to check on
this.

It will also backup 5 1/4 Floppy Disks for Atari 8-bit, Commodore and
others.

It makes a complete backup disk or Image backup. Really Nice.

All I have is the ROM image file of TOS 1.62 (actually completely
legal as well since I also own an STe with TOS 1.62!), so I don't
know how I should create a TOS boot disk without some sort of
loader program.

>Looks like I have a simple way to tranfer those 8-bit files.

No, no, no. You cant' use Discovery Cartridge configuration files to transfer 8-bit files. You can only use them for copying 8-bit disks. And even for this purpose it won't be reliable and in many cases it won't work at all. (Sorry, the explanation is quite long and a bit off-topic).

My software is not a configuration file. Its a fully fledged program that works completely separated from the cartridge software. It uses the cartridge hardware only, not the software.

The quote I posted in my previous message about my software, is from the PD disks sold by B&C. They sell them for u$3 each I believe. So if you can't find it on the net, you may want to contact B&C. As said, I will search my backups. But for some reasons it's not in the CDs I burnt. I need to check my floppies, and that will take a while.

>Without doing a bit of research, I'm not sure if the IB Drive is
>a 720K drive or what.

Format a disk as 720k, if it works, then your drive is 720k. Most drives shipped by I.B. were 360k, and the capacity is mentioned in the front side (40 or 80). But of course, somebody might have changed the drive.

Btw, if you happen to have an 80 tracks drive (720k), then you will be able to transfer 8-bit files and disk only in one direction. From the 8-bit to the ST. To transfer from the ST to the 8-bit youll need to use virgin unformatted disks and the software needs to implement double stepping (mine doesn't).

>Also, I use to have a PC 720K 5 1/4 floppy drive that you could
>connect to the ST with a Cable.
>The Cable was homemade and some of the wires on the Drive
>connection end came loose.
>Anyone know a Source for making a ST cable to PC 5 1/4 Drive?

There are schematics on the net I believe. But youll just make another I.B. drive. An I.B drive is just a standard PC drive plus a power supply, a case with the ST connector and the wiring, nothing else.

>And can one use a High Density PC 5 1/4 Floppy Drive? Since the
>MegaSTE supports HighDensity Drives.

It's not that easy. 5.25 drives are not (density) auto-sensing as the 3.5
ones. You'll need special hardware and software.

No I have renamed Stik2.ovl to Network.ovl and re-run Highwire with no
difference in the "about" modules bit (none). Seems that something has
been altered in the internal configuration. Where are the Modules
supposed to be located? I have them in the "Module" folder inside the
Highwire folder (on D:), do they have to be somewhere else, eg HOME in
Magic? Version 0.2.4 runs OK, so I'm using that as a stop-gap.

Will try the Iconnect.ovl with the new MTU setting in Iconf.

Ta

Neil :-)

Sorry. I must correct myself. What I said in the previous post is valid only for 8-bit single density (FM) disks. You do can reliably copy ED, or DD disks with the right configuration file.

You still won't be able to transfer files though, at least not easily. In theory you could extract the 8-bit files from the image file that the cart software creates. But you'll need special software that AFAIK doesn't exist. The cart images files are in custom format, they are not compatible with any other ST (or 8-bit) image format.

"Phantom" <phantomm@bellsouth.net> writes:

The software needs very strict timing. Anything faster (or slower for that matter) than a bog 8Mhz CPU and it will fail.

If somebody wants to donate a Falcon, I will make a Falcon version (just kidding :)

Seriously, I don't have a Falcon. But probably there are very few cases (with a Falcon, but not a standard ST, and with original copy protected disks) to justify the effort.

Strange, hows that working then ? I think a lot of the progs just went
direct to the BIOS calls to copy track by track... I take it this new prog
is doing some new tricks to actually do the copying ?

Hello,

As far as I know, MTU must be of 1492 with aDSL, and 1500 if pure
ethernet (or cable).
That isn't the only value that can affect the traffic...

sorry but with magic + highwire + iconnect you could crash or even
don't reach some web page with a 512 MTU and have to use 1492
or something else on rtc (yes 1492 for rtc!!) dsl etc...

since you are french re-read this subject on fcsa (12.2003)
http://groups.google.com/groups?hl=fr&lr=lang_fr&th=b8b566854cab968b&rnum=1

1492 MTU solve his problem and "bibou" don't use a dsl line ...
take care of the MTU with iconnect.ovl

1841. Re: Loading TOS 1.62 from file

Newsgroup: comp.sys.atari.st
Date: 2005-05-20 05:33:20 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <yyeje.2558$lQ3.412@bignews5.bellsouth.net>
Source record: 13418

I'm not sure what a TOS Image file actually is.

Is it a copy of the TOS chips placed into some type of single file?

Not sure if this will help, but remember Falcon TOS 4.92?

It was on a Disk and you simply put the disk in the Falcon
and it loaded upon Boot up.
There was talk about burning it into a ROM chip.
Someone may have done it.

If you have a Single File, if there is some way to break it down into
readable files on the STe then you would be close.

AFAIK, all ST-Falcons look at the disk drive first to see if there is
a bootable file. If there is, then it is ran. I believe that is
correct.

There must be some way to do this.
IINM, there is a program that will convert them to disk.
But my memory on this subject has faded abit.
If I come up with something, I'll let ya know.

If I remember correctly. There is a PC program that uses
these TOS Images with a program to run ST software on PCs.
Personally, I didn't like the idea of using TOS Images on PCs,
and I still don't. But that's my opinion.

What is the Tos 1.62 filename and extender?
I'll try to dig up something if no one else has the answer.

Also could you provide the URL for the Images?
I'd like to get those myself. I have 8 Ataris not counting 8-bits.
I've got it bookmarked somewhere on one of my Falcons.
But, there are probably a thousand URLs. (Need to clean them out)

If you don't want to post it, then e-mail it if ya don't mind.

1842. Portfolio and Falcon

Newsgroup: comp.sys.atari.st
Date: 2005-05-20 06:03:06 UTC
From: jdplace@REMOVESPAMcableone.net
Message-ID: <118qvcqobomja80@corp.supernews.com>
Source record: 13419

Since the Windows XP PC I am forced to use at the office will not support my ATARI Portfolio I am looking for an easy way to continue to sync my files with the PC. I decided to try a program called Portlink to transfer files to my Falcon at home and then e-mail them to the office. The program runs fine and sees the files on the portfolio initially, but fails when I try to transfer. I do have the program working fine on my STe, but would like to use it on the Falcon (my primary computer).

I assume the problem is the bi-directional parallel port on the Falcon? I built the cable as below which works fine for the STe. Can it be modified to work with the Falcon? An except from the Portlink doc follows:

(some of you will notice that the data and clock signals are at bit 0 and 1 for one way and 6 and 7 the other way, this is to gain extra speed - it's faster to shift in/out these bits on the port)

```
Portfolio Atari ST
parallel- printer-
interface port

2 <------- Data from Atari ST <-------- 2

3 <------- Clock from Atari ST <------- 3

.---- 12 -------> Clock from Portfolio ------> 8
+ |
LED 13 -------> Data from Portfolio -------> 9
- |
'---- 18 -------------- Ground --------------- 18
```

The LED referenced in the manual (to monitor the clock signal) can be connected between pins 12 and 18 on the Portfolio side. You don't have to have a LED, but it will ease the use a lot !

I tried this and used that images with STeem version 3.2 on my wife's PC.
Worked just great. I am going to try and get Linux working on my Hades again.
Steem also comes in a Linux-supported version, so it would be great to store
some of my favorite ST games on my Hades hard drive.

I tried running Pasti on my Hades. It did run, but when it went to copy the ST game disk, it told me my floppy was not correct. Seems it needs a 720K drive. Would be great if the author fixed Pasti so Hades, Milan, TT and Falcon owners who have 1.44 meg floppy drives could use it.

Just a thought: Whats wrong with Magic Shadow Archiver? It does exactly
what Pasti claims, eg, it makes images of floppy disks. Esp the protected
ones. There are MASSIVE archives of MSAed demos and games etc. Those MSA
images are 'preservation of floppies in their original form'. It's here
quite looong time, so do we really need to invent hot water again with
Pasti? Not to mention that new MSA apps like JayMSA offer extensive
options, packing etc.. Another format apart from *.MSA is *.DIM, which
stands for Disk IMages and its FastCopy PRO generated format. Both
applications are used for more as 10 years, runs well on all ataris and MSA
especially is widely used all those years and now. Steem also read MSA so i
really don't see a point. There are CDs with thousands of demos in MSA
already, same for nt so legal game CDs. Why convert all that again to
basicaly same format? And who will do it?

Janez

No, it doesn't. MSA makes images of disks *without* copy protection. It
can't handle any type of on-disk copy protection.

> There are MASSIVE archives of MSAed demos and games etc. Those MSA
> images are 'preservation of floppies in their original form'.

No. Those images are takes from cracked versions, not from the originals
(except for the minority of original disks without copy protection).

> Not to mention that new MSA apps like JayMSA offer extensive
> options, packing etc.. Another format apart from *.MSA is *.DIM, which
> stands for Disk IMages and its FastCopy PRO generated format.

All these formats are for disks without copy protection.

> Steem also read MSA so i really don't see a point.

Well, both Steem and Saint authors modified their emulators to add support
for Pasti. Seems like they see a point.

Where you got the idea that MSA and DIM images support copy protection?
Haven't you seen on almost every one of those images messages like
"Cracked by xxx", or "xxx Team presents ..."?

The problem is not the 1.44 drive but the faster CPU (yes, the error
message is misleading).

It is noted in the documentation. The Imaging Tool doesn't run on TT or
Falcon. It won't run either on any machine without a standard 8 Mhz CPU
(such as the Hades).

Bonsoir :)

Download on my "maison-page" or direclty in the folder
http://rajah.atari.org/files/ -> troll11c_uk.zip (~ 130KB)

Fixes in this version 1.1C:
- crash after text block selection with mouse, outside text zone.
- possible crash after pasting text block (a line was lost).
- freeze if text and headers to send was more than 2000 bytes.
- some text cursor redraws.
- 'Tab' key do not open the About window any longer
Thanks Jean-Luc ;)

Voilï¿½ :)

1860. Re: IB DRIVE for ST/STE

Newsgroup: comp.sys.atari.st
Date: 2005-05-21 17:27:46 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <h8Kje.7408$8S5.5181@bignews3.bellsouth.net>
Source record: 13437

The idea I had was to copy the 8ibit Image file that the cart makes back
to
a 3 1/2 drive.

If that doesn't work then I'll try a few other ideas I have.

If nothing else then I have a way to back up Protected 8-bit disks
in Image files.

I have STXFORMER and the Cable to connect the 8-bit to the ST
and transfer files that way. I've not gotten into that yet.
Wanted to see what all I could do with the HAPPY first.

I have 2 Happy disk editors that look similar to FastCopy Pro
have explored those yet.

The I.B. Drive I have is 720K. From the TOS 1.62 DeskTop it will format
SS or DS 5 1/4 floppy disks. Over 720K bytes for DS.

I also found a ST program that will format MSDOS disks on the ST.
3 1/2 and 5 1/4 but only SS for 5 1/4.

However I tried FASTCOPY PRO and had problems formatting with the drive.
I think it was due to the Twister format where the disk gets formatted
backwards.
I have to check and see if there is a option to turn this off.

FastCopy PRO does support 5 1/4 disks even High Density ones.

You mention that you created a program to transfer 8-bit files with the
Happy?

Do you remember the name of it?

The Image files that the Happy makes are suppose to be exact copies of
the disk you copy, what ever the type, Mac, PC, ST, etc. and when you
tranfer the Image back to a disk, then you get a exact copy of the disk.

At least thats the way I read it from the manual.

And of course you can copy disk to disk to make a copy without
making a Image file first. Great thing about the Image files is you
can store them on CD/Hard Drive and make a exact Disk copy
when you need it. And they can be transfered across phone lines.

BTW, I ran into a program that allows you to connect Atari 8-bit Disk
Drives to the ST and use them as ST drives.
Down side is it doesnt support Atari 8-bit Disks.

Does anyone know what the last version of the Happy Discovery
Cartridge software was?
And any support files for it?

Someone must have one of these besides myself.

1864. Magic Mouse Click Delay

Newsgroup: comp.sys.atari.st
Date: 2005-05-21 20:03:19 UTC
From: mail@freeman-studio.com
Message-ID: <1116705799.332108.107830@g49g2000cwa.googlegroups.com>
Source record: 13441

When I switched from Geneva to Magic 6.01 a few years back, I noticed that Magic had a bit of a delay between the time you press the mouse button and the time the system acts on that click. It's somewhere between 1/4 and 1/2 a second. I thought it was just something to do with the speed of my system. But now I have a CT60, and the delay is still there. Does anyone know what causes this, and if there is a fix?

An example of this can be seen when I try to highlight text in Papyrus. I have to click, hold the mouse still for a bit, then move it. Otherwise, if I click and immediately move the mouse, the first part of the text that I move past doesn't get highlighted. Another example is when playing one of the Minesweeper games. If I quickly click on a bunch of spaces without stopping for a bit over each one, they either don't get marked, or the wrong ones get marked.

So, does anyone have any clues to what's going on? I've tried changing my Timeslice and Priority settings, with no effect. I have my mouse double-click speed set at nearly the fastest speed. I'm not sure what else to check, or if there's even anything to do about it, other than switch to Mint (which I won't do until there's a good enough GUI on it that can compete with Magic's).

Thanks!

Don't think so. Don't know exactly what "Backwards" is or how it works,
but it is unlikely that anything would be able to bring a Falcon to the
required level of compatibility with a standard ST or STe.

And you will end where you started. The problem is not the media. It is the difference in low and high level format. You won't change that by changing the media. So you won't gain virtually anything.

>If nothing else then I have a way to back up Protected 8-bit disks
>in Image files.

No. The backup software that comes with the cartridge is for MFM disks only. But 99.99% of the 8-bit copy protected disks are single density (FM). So you will be able to backup only Atari Planetarium plus the other handful of protected disks in enhanced density that exist, nothing else.

In theory you can backup any encoding (including FM) using blind flux transition mode. But as the documentation states, this is not very reliable for a whole track let alone for a whole disk. Furthermore, for most 8-bit disks it won't work at all.

This is a limitation of the software, not of the hardware.

>You mention that you created a program to transfer 8-bit files with the
>Happy? Do you remember the name of it?

I told you already, "DiscLink". I also already told you where to get it (at B&C) for just U$3 (don't worry, I won't receive a penny). I also already told you that I must check my backup floppies to find it myself. This will take some time.

>The Image files that the Happy makes are suppose to be exact copies of
>the disk you copy, what ever the type, Mac, PC, ST, etc. and when you
>tranfer the Image back to a disk, then you get a exact copy of the disk.

Again, you won't gain anything by doing this. You want to transfer files between the ST and the 8-bit, not making an exact copy of a disk.

Your just full of overflowing encouragement aren't ya. 8-)

I get the message that in your opinion I'm just wasting my time.

I'm getting results and won't publish them here.

I can easily write my own backup files to use with the
Discovery Cart with any text editor.

Also, That was the first time I heard the name of the
program you wrote.

So, I'll keep my Happy thoughts and Happy results and my
Happy devices to myself for now...

Hey wait a minute something is starting to smell.....

You are involved with that PASTI program.

That clears alot of things up.

I've never seen that software before.

I'm really surprised that there isn't a built-in way to access ethernet
from within MagiCMac - I'm using the OS X version.

Problem is more deep as simple Backward. Good copy protection can be clock cycle precise, etc and basically u need original hardware to read the floppy. I thought Pasti is just another variation of MSA of FastCopyPRO, which can deal with quite a number of protections, but complex ones are a pain and if Pasti will be able to deal with them, it will indeed be cool. Anyway, copy protections are far more complex as switching cache on/off, cpu from 16 to 8mhz etc what backward is doing...

I understand what you are saying.

I don't know if you have a Falcon and ever used Backwards or not.

The program does allow Original Protected ST/STE Games to
Run on the Falcon that would not normally.
Not all games will work, but alot will.

But one could try backwards and see if it would work.
I know that alot of Protected ST/STE games will work on the Falcon
due to Backwards.

It's worth trying and if it doesn't work then nothing lost.

Also I was making a Joke related to another thread.

My personal Opinion is this is re-inventing something
already done. I know alot of software that will make
Disk Images of Protected Software.
It seems that alot of folks have either forgotten them
or don't know about them.

I'll make a Deal here, I'll stay out of this thread if
Jorge stays out of mine.

Ok, I think I have the name of the software used with them.

Universal Network and I the last version of software was
v.1.02 if my info is correct.

I'm doing some searching for the software.

If anyone happens to have it available and or manuals.
Contact me.

From: "Ronald J. Hall" <dark_lord@charter.net>
Message-ID: <pan.2005.05.23.14.59.53.811896@charter.net>
Source record: 13305

Well, I've just about given up on chatting with fellow Atarians live on IRC... :-(

I have a Dlink hardware router/firewall, as well as running shorewall (software firewall) on my Linux box. To rule out why I can't connect, I completely turned off the software firewall and opened up my comps IP address as a DMZ. (I would never do this if it was a Windoze box!). :-)

BUT...I still can't connect to stealth. Here is the output from Xchat:

```
--- Looking up irc.stealth.net..
--- Connecting to open.pl.ircnet.net (82.146.235.2) port 5550..
--- Connection failed. Error: Connection refused
Cycling to next server in IRCNet...
--- Disconnected ().
```

and then it goes through this seemingly endless cycle where it tries different servers - all with the same results. I let it run for about an hour. :-(

Anyone have any ideas? Thanks!

1879. Universal Network MIDI Software

Hello,

I have 2 MIDI units that supose to allow one to connect 2 Ataris
with the MIDI Ports.

Problem is I don't have the software or Manuals.

AFAIK the name of the software is Universal Network v.1.02.

I think it was by AD Hardware/Software.

I've done some searching on the Net but haven't found the software.

If someone knows where to get the software on the Net and or
has the original software and manuals, E-mail me please.

Thanks,
phantomm@bellsouth.net

From: kevin <kevnospam242@gmail.com>
Message-ID: <06t491tvgm7h12tvrgfjailt9femc76pfq@4ax.com>
Source record: 13309

I just picked up a nice 520stm system. It also came with an external floppy drive some manuals and I have an Atari monitor plus a mouse I found someplace else. So finally I have a usable Atari ST, but I find that most games require 1meg.

I would like to upgrade my 520 to 1meg and I have heard of a "piggy back" technique which sounds easy, but has anyone here done it? Anyone know a place I could find detailed directions?

Are there any other easy and preferably inexpensive ways to upgrade the original 520ST to 1meg?

any help or advice would be appreciated.

Kevin

1884. *Looking for a few ST-Falcon Items*

Could use the following items....

ST-Falcon Brown/Black Leather type Computer
Dust Covers.

ST-Falcon Cartridge PCB cartridges. Blank or partial
blank cartridges for projects.

Good very Clean working Mega ST Keyboard.
Must have all keys.
Original one wanted, but may accept a MegaSTE
one instead.

Any type of electronic projects that connect to
an Atari ST/Mega/STE.

Replay 16 cartridge or similar with same or better
quality.

Non-Working Falcon(s)

Falcon ScreenEye Digitizer

Falcon FPUs (working)

Tos 1.62- Tos 2.06 hardware switcher for 1040STE.

Non working Graphics cards, and various upgrades for
STE thru Falcon.

SCSI cases of different sizes for Hard Drives/CD-Rom Drives.

MegaFile 30 or 60 hard drive.

Unusual hardware for ST-Falcons.

E-mail me if you have any of these for sale or trade.

phantomm@bellsouth.net

Kiselo,

What mouse settings should I check, exactly? I've checked everything I can think of. Also, the problem doesn't seem to exist with TOS or Geneva. Haven't checked it with any other OS, really. But I've checked everything I know to check. Is there something specific that you know of that I might be overlooking? Thanks!

Hi, Kevin!

k> I would like to upgrade my 520 to 1meg and I have heard of a "piggy
k> back" technique which sounds easy, but has anyone here done it?

I'd prefer soldering a 4MB SIMM module:

+ full memory upgrade
+ SIMMs can be found easier than the DRAM-ICs needed for the "piggy back"
solution
- you need to solder more wires than for "piggy back"
- you must turn the DRAM-ICs on the ST-board off

Still I think that soldering a module is not much more effort than the
"piggy back" solution.

BTW: Instructions can be found on the net.

Regards,

Alexander

Hi, Mike!

> Does anyone know what causes this, and if there is a fix?

Sorry, I never did experience such a kind of delay on any Atari system.

Did you check with a raw MagiC-Setup (i.e. no additional AUTO folder
programs, no accessoires) as well?

The fact that this does not happen with TOS or Geneva running indicates
that your hardware is ok.

Regards,

Alexander

I have 2 520st's and one is in great shape (the other one has a nasty
yellow color on the keyboard which I am going to try to remove) I
havent had much luck getting a 1040 or STE or any of the other higher
numbered models... of course if I was willing to pay alot of money
sure, but this is just a hobby (retro computer/gaming)... Im suprised
it is so involved to upgrade this little guy, compared to the AMiga
where you just plug in a little card....

Not sure about any of these. Cheapest way is probably to buy a pre-upgraded
machine from e-bay.

> Any way I can network a pc to this machine

Mounting drives from a PC is tricky. You can use PARCP to copy files. You
could

> or a cheap way to add a hard drive?

Not found any. Look for an interface or workin drive on ebay. E.g.

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=5200082734

I am suprised you have had trouble getting an STE. There are two on E-Bay
UK, one with a hard drive. With an STE it is just a matter of pluging in 30
pin simms. STFM has space for 1 meg but getting the chips is now difficult.

I've got about 3 STFM's with 1 MB and 1.44 floppy for sale, though unless
your in the UK you wont want to pay the postal costs!

damn Chris!!! You got my hopes up for a min there! Here in the US it
is hard to find anyuthing but 520's everything else (including
upgrades/peripheals) seem to be terribly over priced. Then again I
have just started looking.

My problem is I live in Connecticut, USA. The ST was not as popular over here and so is more difficult to find machines for sale. The ones I do find tend to be pretty pricey. I just bought the good condition 520ST from someone who still uses ATari's (along with pc's and mac's) in his home recording studio, but he would not give up any of the more advanced ST's. Even if I had STfm I could prob find the chips or might have them already in something else I have lying around, but I would love to get an STE around here if I could.

I dont have a prob wih the 520, if I could just upgrade it so it was more compatible. I havent looked to see if it will accept a Blitter and if it does +1meg and the stereo tweety board, I will pretty much end up with a STE when I am done.

Your not the only one who said that too, a few people around the world are interested in such machines, but postage from the UK costs more than the machine is worth. The only solution (if you cant find one) is I could sort out a 1MB motherboard for you and possibly just post that to you, though its still going to work out a fair bit to do that, though not as much as shipping the entire ST!

what is the shipping like from the UK to the US? Also I wonder if I
did buy the mb, are there two versions (PAL and NTSC) like the 8bits?

I found a few "Disk-TOS" files, which is probably what I need:
http://home.ptd.net/~cjhafner/
I'll try them out when I get the time.

You were asking about TOS image files yourself -take a look at
the above website ;-)

By the way, does anyone know about the legal situation for TOS at
the moment?
I don't support piracy, but since the Atari ST is no longer sold,
and neither is TOS, I can't see who's going to suffer from people
putting up TOS image files on websites for other people to download.

Hi, Mike!

> Yes, the same occurs with a "raw" Magic setup.

Do you have another Atari to install your MagiC 6.01 on? Or do you have
different Versions of MagiC to check the mouse behaviour with them?

You see, I am running out of ideas :-/

ahh yes, PAL here, I've not seen many NTSC machines over here. I would have
to check on post costs. At a rough guess I would say around $30 but it is
just a guess.

Message-ID: <d722jm$sm9$1@reader1.panix.com>
Source record: 13339

There have been requests for such programs. There are a lot of them, but the source costs a little.

On E-Bay, one regular offering is Max Atari DVD, which has a lot of CD files in self-extracting winrar form. That may be a problem, and again maybe not. In the CDs on that DVD are one Atari disk, made mostly from Current Notes PD game files, and hidden on the Qwiknotes disk are a large collection of both mono and color programs. It also has quick notes files, and covers both Atari and Ameoba, or Amiga, in clipart and programs.

There are Delta and Ausgabe disks, and the Gutenberg Project, and the Electronic Spinster clipart disks also on the DVD.

I think it is well worth the money.

Hmm, Hades 060 freeMiNT 1.16.3/XaAES NVDI 5.03
With Cab 2.8 (SSL 1.8404 ovl) I can access all the pages mentioned
above without any problem. Only the text in the middle of the opening
page isn't displayed.

> where you just plug in a little card....

Hmm, just wanted to point out that you might be mixing apples and oranges there. The original Amiga A1000 wasn't all that easy to upgrade either, and it would be more comparable to the original 520ST.

If you were talking about an A500 then I would compare it to the STe...

An A1200 to the Falcon...(although overall, I still think the Falcon kicks its butt). :-)

Not wanting to start a flame-war, just a random thought... :-)

1918. [ANN] Fixes for Crésus (1.0B)

Newsgroup: comp.sys.atari.st
Date: 2005-05-25 20:04:39 UTC

Message-ID: <4294da57$0$300$7a628cd7@news.club-internet.fr>
Source record: 13345

Bonsoir :)

Download on my website or directly in the folder
http://rajah.atari.org/files/ -> cresus10b_uk.zip (170 KB)

Fixes:
- some small files with bizarre names where wronly created
into the ACCOUNTS folder. Corrected, but if you find ones,
delete them.
- for type of transaction with transfer: indicate the inverse
type via the new pop-up selector (ie if debtor transfer,
declare its corresponding creditor transfer). The display
and names will be more correct (wording and "<- FROM ACCOUNT"
in the notes).
- if an account was edited and modified, the amounts were
reset to 0. This won't happen any longer, but do keep in
mind these amounts are only indicative, and truly set when
a transaction table was loaded.

If update from the 1.0, just replace the PRG, RSC and HYP files.
Thanks to Olviier, Jean-Luc and Strider ;)

Voilï¿½ :)

There were some changes between the 8019 and the 8019AS. I always
recommend 8019AS.

1927. Atari 8-bit files to Atari ST Disks

Newsgroup: comp.sys.atari.st
Date: 2005-05-26 17:50:40 UTC
From: Phantom <phantomm@bellsouth.net>
Message-ID: <FXnle.21719$8S5.3788@bignews3.bellsouth.net>
Source record: 13354

Greetings,

I've been experimenting with transfering Atari 8-bit files to
Atari ST disks using a Xformer Cable, 1050 disk drive and
different software.

As some of you know, ST Xformer was a package that was
suppose to do this. I have this package.

However, I found it abit hard to use and went looking for a
simple way to tranfer 8-bit files with a 1050 and Xformer cable.

I have stumbled onto different ways to do this with software and
am thinking of putting a software disk or CD together and make
it available if any one is interested.

The software's main goal is to transfer the Atari 8-bit files with
a Atari 1050 or other Atari 8-bit drive over to Atari ST 3 1/2 disks
as fast and simple as possible.

Once transfered the 8-bit files will be on ST readable disks in
at least DD format. They can then be copied to a Atari ST hard
drive. Also they are ready to run so they will work with most
Atari ST-Falcon 8-bit software emulators.

I have already transfered 8-bit files with a ICD US Doubler 1050.
Just about any Atari 8-bit drive should work.

Transfering the 8-bit files directly to a ST hard drive is also
a possibility I am looking into, along with a few more things.

I am going to put a package together for my self at least.

Would anyone be interested in a software package along
with docs on how to best use it?

A Xformer Cable is a must along with a 8-bit disk drive.
At this time I am not going to supply these. but will put info
on how to build the cable in the package.

If there is any interest then e-mail me or post.

phantomm@bellsouth.net

Has anyone had success with a Microtech PCD 47B triple card reader?
I know some people have tried scsi card readers in the past, and some
of them worked. Also what version of HD driver is best for this type of
thing?
Thanks, Mark

I have that card reader and it did not work for me on my Falcon. The
drive does not show up when I try to partion. It does show up on the
bus scan.

I have Xformer for my STe and I think the cable also. Have not used it in a while. I am doing the same thing as you only I am doing it in a different way. I am using a program called 800XLDJ which is a program that runs on a ST that emulates an 8-bit drive. It connects and is used with the same cable that APE (for the PC uses) the SIO2PC(ST) cable. I am putting alot of DI images on a CD that can be read by the ST and loaded into my 130XE. Works great... It can also be used to transfer 8-bit files to the ST directly if you want. Just hook up an 8-bit drive to the 130XE or 800XL, connect the SIO2PC(ST) cable to the 8-bit drive and then to the ST (through modem-1 port on a Hades,TT etc). Bring up 800XLDJ and set the emulator to drive 2. Put an 8-bit disk into drive 1. Tell the 8-bit computer to copy disk 1 to disk 2. The files will appear on the ST desktop. Then either drag the files to the ST desktop (under Mint, Magic,etc) or highlight the wanted files and tell 800XLDJ to do it.

Your way is fine also and Xformer does work fine, but the one problem is gettng the cable. I know I have it somewhere. I am going to have to to look for it.

800xldj can be gotten at:

1933. How to check available memory in STE

Newsgroup: comp.sys.atari.st
Date: 2005-05-27 07:47:16 UTC
From: Tero S��rel� <tsaarela@paju.oulu.fi>

Source record: 13359

My friend got this 520 STE that he found for 1 euro from fleamarket. It works fine although it is a little hard to use without a mouse.

I had some SIMM memory (absolytely no idea how much memory in those combs) so we decided to throw those in the STE. We installed the SIMM combs and put the STE back together to see whether it would still boot up. The STE booted up nicely but there was no utility in GEM which would tell how much memory there is. Is an external application only way or is there any other way to check the amount of memory installed?

Br,

Tero

I use a little program called memwatch. You just run it and it will keep track
and display how much free memory you have. It also displays the total amount
of memory. You can download it on the or net or just email me and I will send
it to you.

If you have the newer control panel, and the general setup CPX module,
then you can click on "status" and it will show the amount of free ST Ram.
It will give you an idea anyways.

HTHs.

Mike,

There definitely has to be something with your specific software config.
I've never seen this happen. Check for programs using excessive CPU time.

Stealth is dead and long has been . As an american user you MUST use
either us.ircnet.org or irc1.us.ircnet.net. Try both of them, one of them
should work. Depending on where you are in the country and what ISP you
use, sometimes entire blocks of IP's are blocked due to mischievous users.
Ircnet is one of the most annoying networks for american users but right
now, things aren't that bad.

Thanks,
Mark

Using Xchat under Mandrake Linux here, I added both to my networks and
tried both of them. Both us.ircnet.org and irc1.us.ircnet.net gave:

Unknown host. Maybe you misspelled it?

Guess it just wasn't meant to be. :-(

PS Xchat works, I join channel mandriva and chat there all the time.

Thanks for the help though.

Source record: 13366

At the moment I have no idea.

You could try Bravo Computers or other
Atari Dealers.
Sometimes you can find a complete package with cable.
I bought mine used but in like new condition.

I have several versions, v. 2.55 is the last version AFAIK.

But using it alone, I couldn't transfer 8-bit disks.
Maybe others have had luck.

Thats why I tried different software and etc until I found
a very reliable/fast way to do it.

If there is interest in a package for the public then I'll release it.

I am still working on the package adding more stuff.
Alot of 8-bitters use 8-bit files on PCs.
I may add the ability to transfer 8-bit files to PC compatible Disks
using
the Atari ST and maybe the Falcon.

I will be looking at Falcon support as well. The ST disks can be used
on the Falcon. But haven't tried transfering 8-bit files with a 1050
connected
to the Falcon yet. If I get it working, there may be HD disk support and
direct
to the Falcon hard drive support.

I have a very large collection of Atari 8-bit files, that I've not seen
anywhere.
Maybe some of them are on CD or etc. But I think alot are abit rare.

Before the Net came. I ran a small 8-bit PDS service and traded software
with folks around the world thru snail mail. Those are days of no more.

Now with instant messaging I think alot is lost.

Getting a 1 or 2 page letter from someone in the UK, Poland or other
country back then is much different than getting e-mail.

SO much more goes into a letter written the old way as it takes time
to respond.
That is mostly lost now.
Enough of my ramblings.....

I am going to transfer my Atari8-bit software to hard drives and CDs to
preserve it. It will take alwhile as I have at least a couple thousand
disks.

Even though I have my disks in good plastic boxes. I am seeing the
sign of age getting to some of them. These floppies won't last forever.

phantomm@bellsouth.net

I think that there was a shareware or maybe a freeware version.
Try the FTP sites. Or do a search for ST XFORMER.

Source record: 13372

Hi Ed,

I have 800xldj, not sure if its the latest version, will check.

Also have a SIO2PC device that allows you to connect the 8-bit SIO cable to
the PC. I have the cable that connects to the PC.
I just bought this new a few months ago. Can't remember if the PC cable end
is a serial or printer type conection. Let me get it here and look.....

ok, THe SIO2PC board has the standard Atari8-bit SIO connector on one end.
On the other end is a standard 9 pin female connector just like the end of a
ST mouse or joystick. This connector is used as a serial connector also for
modems and such. It has 3 Leds on it. I need to put it into a small case as the
one I got is the bare board type. It's about 3-4 inches long.

The cable I got with the SIO2PC, has male 9pin on one end and female 9pin
on the other. I've never used it yet, so I guess it connects to a PC
serial port.

AFAIK they still have some for sale. I also picked up a Atari 8-bit USB cartridge.
Those 8-bitters are on the job!!!

The STe doesn't have the 9pin serial, but the MSTE and TT does as well as the Falcon.
One might get a compatible cable for the ST/STE if one could get it working.

Is this the same device as you have?
I know different versions were made, be nice if there were some way to use
it on the Falcon.

Getting the Xformer Cable is the biggest problem. They aren't a standard cable
as you already know. I have docs and maybe some diagrams on how to make em.
I think they are on the Net as well.

If I had the extra time I'd make a few.
I do have a extra one that I might sell but need to check to make
sure it works.

You can check out the SIO2PC device at:
www.atarimax.com/sio2pc/

You will see Pics of the devices. 1 has terminals at the end instead of
the SIO Jack.
Price isn't bad for this little device. It's well made.

Also, I just found this site below. It has alot of info/downloads and
etc relating to
emulation of ST/8-bit/Mac.

There is also information on how to modify the basic Xformer cable so
that it will work
on a PC and the ST. A simple mod and resistor is all thats needed.
Interesting!!

Lots to read here....
www.emulators.com/index.htm

I did see some pin outs for the basic and modified Xformer cable.
Not sure if enough info is on there to make the cable or not.

I know in the past, I've seen the info on how to make em on the NET.

Not sure if I will modify my cable to work on a PC or not.
Maybe on my extra one. It would be cool to have a 1050 connected
to a PC. My VAIO Laptop with a 1050 or maybe some other 8-bit
item. Something I'll think about.

As I am already looking into writing the 8-bit files to disks that
can be read by PCs. And if you transfer the files to your ST-Falcon and
have a CD Burner. Then you can put them on a CD and access them from the
PC's CDROM. If you want to run a 8-bit emulator on a PC.

Myself, I'd rather do it on a ST/STE or Falcon.

I appreciate the information you have provided Edward.

I just picked up a nice Yamaha CRW 4416SX (4x4x16) External unit.
It has 2- 50pin SCSI ports on the back just like on the Falcon.

Does anyone know if this model works at all with SoundPools CD Recorder
Software?

If so what version, if not all versions.

Hey gang. Is there anywhere on the 'Net that a person can download some of the old Atari videos from? I mean like, old commercials, interviews, annoucements, things like that. I'd love to watch some of them again.

I just tried the Atari Historical Museum, and using Firefox, Galeon and Konqeruor, I get "page not found or displayed" messages. You can't download them either, you just get a 3.9kb file or something like that.

Thanks! :-)

There are no known issues with HDDRIVER and the CT060 as long as your
CT060 firmware is up-to-date, which is an important requirement.
HDDRIVER (in particular the current version 8.1, see
http://www.seimet.de/hddriver_english.html) and the CT060 have been
tested extensively in the meantime.

Are you sure that you configured HDDRIVER to check for your reader's ID
when booting? If a device shows up when scanning but is not offered for
partitioning or formatting it usually means that the device ID was not
checked.
Did HDDRIVER show the device name when booting?

Yes, HDDRIVER was set to check for all SCSI IDs. I think the device
is at fault. I know others have had trouble with the triple card
reader, where the double card reader works fine.

Thanks,

I see. Do you still have access to this device? If you have and if you have time to test it I would like to know if the device name was displayed when booting.
In general HDDRIVER does not make a difference between the various SCSI device types, i.e. it should not matter whether you have connected a real hard disk drive or a card reader. But, of course, it is required that the device correctly implements the SCSI standard.

in answer to your and my own question... Shiraz is working as the VP of engineering for Canesta corp. according to their website "Canesta is the inventor of a revolutionary, low-cost electronic perception technology that enables ordinary electronic devices to perceive and react to nearby objects or individuals in real time." It mentions he also worked for: Kaveri Networks, Advance1 Logic, Momenta, Atari, and Cirrus.

Hi,

this emulator appears as a disaster, especially EmuTOS.
Meanwhile I have entered the TOS404.img into the config file but the tos
tries to store the desktop.inf on A: (floppy).
Then I entered into the config for C: and D: the corresponding folders
of the unix directory, but cannot access them from the Atari-Desktop.
Is this caused by the betaDOS missing? Where have I to enter the betaDOS
in this case?
And how can I setup a resolution of 800x600?
And how switch off the RAM test that is done when booting?
And return to Linux without shutting down the Atari?
I haven't found a documentation for the config file.
Why can't I buy aranym/Linux ready for use with legal TOS404 or TOS492?
Please help.

regards, Ludwig

What you just have to do is to buy a Macintosh with MacOSX.
You then download <http://eureka.atari.org/MacAranym.zip>
It is ready to use, and already configured. Simple !

I hope that I will have helped.

Hi groupies :-)

I was wondering if it was possible to keep the time by applying backup power to the keyboard controller? Was also wondering if the ST booting up would reset the thing (and the time).

At the moment thinking about a 40-pin DIL header plug trailing off to a small board to hold the Hitachi PIC with a couple of NiMH 3.6v charging while the ST is powered.

Any views or experience in this??

Thanks,

Alison C, Cambridge UK

If my memory serves me correctly it has three IDs and one LUN. It
shows up in the boot process, but will not show up to format or
partition. I can dig it out again and try it, but it is an internal
unit so I have to use an external case/power supply to test it again
at this point. I'd really like to find one of the external models
that would hopefully work!

Sounds like a good project to try.

ST clock cartridges all used some type of battery.

Some were very large. I have a Navarone ST/STE Clock cart and
it's the same size as a VideoMaster cartridge, and has a pass thru port.
It includes it's own software. Not sure if you have to use it or not to
keep
the Time/Date correct on the ST/STe.

It needs the battery replaced. Just never got around to soldering in a
new one.

Even though the cartridge is large, I don't recall alot of componets on
the
PCB. And I've seen some carts that are quite small.

I don't see why a internal one wouldn't work. Unless you need a software
patch to keep the date from resetting or something.

Even if thats the case, and you can't program. Maybe some of the
software
from various clock carts would work. It's a long shot but ya never know.

My 2cents.

HDDRIVER does not check more than two logical units (LUNs) and if there
are actually three, which would be unusual, the third LUN will simply be
ignored without any side effects. It will just not be accessible.

AFAIK the time and date are only reset at switch on because there is
no backup clock, although I could be wrong, don't forget that if you
want the date to be correct you have two problems.
1st, you will have to use some kind of 2K fix program to patch the
date as the original clock memory space does not allow for dates
beyond that, its possible that those used with cartridge based battery
backed clocks will work.
2nd, even if you can patch the date for system display beyond the year
2000 the year shown on saved files may be either 00 or ** (I can't
remember which off hand) not the clock year although this may depend
on your TOS version. Anyone know of a software patch that can correct
this?

> At the moment thinking about a 40-pin DIL header plug trailing off

I looked at adding a battery back up to the keyboard controller but
abandonded it because I was looking at interupting the power from the
Keyboard to motherboard cable and decided that the battery would end
up powering the entire keyboard PCB thus creating too large a drain on
the battery, plus the file save date problem really rendered the whole
thing useless.
Relocating the controller chip to another location is a much better
idea, don't know why I did not think of that unless it was because I
deemed it too difficult for people to fit themselves.

If the controller chip is in a socket thats not to bad but IIRC it is
soldered into the board and thus not easy to desolder without the

correct equipment. If you do manage to remover it have you condidered how you are going to enuse that only the controller chip recieves the battery power? If not you could use a diode with a low forward voltage drop (Schottky) that take power form the main supply when the ST is on (forward biased) but blocks the battery power when the main supply is off as it will be reverse biased although a FET wold be better as it will have a lower voltage drop.
I was planning on using alkaline batteries in my design and so have never tried to build a battery charger so I can't help you there but you will have to look at this aspect carefully as charging them slowly might not charge them enough and chraging them quickly may draw to much current from the main supply, plus you will ideally need some charged circuit to stop them from being chrage once thay are at thier maximum capacity.

Stephen Moss

Although I've never tried this myself, you might want to take a look at
the "Real-time clock" archive, available for download from the Misc
section of my website, address in sig.

Hiya :-)

okies, time to go through these one by one.

RE: Clock Cartridges
From what I've found out, clock cartridges ALWAYS require a little bit of software to transfer the clock info stored by the cartridge to the ST.

As for Y2K, I'll get to that in the reply to Stephen.

Aly :-)

Oooooh Y2K, that old hat :-)

Following on from Phantom's post, Y2K seems to only affect the clock cartridges that plug into the cartridge port. Well, the clocks have no problem with Y2K but the software for the cartridges to transfer the info to the system clock are where things fall foul.

There's a site out there where they were talking all about the different TOS versions, saying Y2K affected TOS right upto version 3 or something. Then some bright spark said it was the software for the cartridges which was the problem.

Still haven't got round to getting the language disks and XCONTROL etc. sourced yet so not tried with the system clock directly yet. Next little job :-)

Right, off there now. Thanks :-)
